24492. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: 2009-01-01 10:27:25 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 24492

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

24493. TX Error Message

Yahoo group: FT897 (2009)
Date: 2009-01-01 16:06:36 UTC
From: MASH
Topic: 24493 Message: 24493

Happy New Year Everyone:
I am getting a "TX Error" message. When I searched the manual
for the key words "TX Error" the search came back with 0
results. I suspect this is not a High SWR error for the FT-897D
has another message for that. Nevertheless I check my SWR with
an antenna analyzer and its coax loss and they are normal. I
also physically checked all connections and they are normal. Any
ideas on solving this problem?

Hello Cliff,

You are transmitting within an alocated band aren't you? Only you get that message when trying to transmit out of band.

Thanks,

Paul.

24496. RE: [FT897] TX Error Message

Yahoo group: FT897 (2009)
Date: 2009-01-01 23:49:42 UTC
From: Eric van de Weyer
Topic: 24493 Message: 24496

Hi Cliff,

The message is telling you that you are attempting to transmit out of band. If you are set to an in-band frequency, check that you don't have either the repeater offset on, which could be pushing your transmit out of band, or that you don't have a split set which takes you out of band.

The other possibility is that the radio is set for the wrong region so it is out of band for that region, even if it isn't for your region. For instance, if you have a radio which is set up for Australia and you are trying to transmit between 3.7 and 4.0 MHz, you will get this message as in VK our 80m band only goes up to 3.8 max.

73....Eric VK2VE.

24497. Re: [FT897] TX Error Message

Yahoo group: FT897 (2009)
Date: 2009-01-02 00:03:37 UTC
From: Brandon Cruz
Topic: 24493 Message: 24497

The 'TX Error' can also appear when the rig is operating in a band where TX is allowed if a key (or set of paddles) is shorted when the rig is powered on. If I accidentally have a key paddle pushed when the rig is turned on that condition can occur. If you have a key or paddles connected try unplugging it and then powering the rig off and then back on to see if it clears the message. If you don't have a key connected you might want to check the jack to see if it has a problem. The 897D will do strange things if the rig powers up with a key closed.

24499. HSWR using Atlas 120

Yahoo group: FT897 (2009)
Date: 2009-01-01 19:24:58 UTC
From: gardfire5
Topic: 24499 Message: 24499

I am new to the world of HF. I got my general license in August and I am just now getting into HF. My 897 is showing HSWR when I try to tuning on 40 meters. It takes forever to tune on 40m but it is right on the money at 20m. Here's the set up, 897 into a double male PL-259=>6ft coax into the MFJ 4602=> 50 coax into a double female PL-259 into K400C which rests my Atlas 120. It's mounted into the ground roughly 2 ft on a steel post. Like I said I am new to HF and trying to learn as much as possible. I am pretty sure that it is grounded well. I am really looking forward to working 40 meters. I am renting right now so anything below that is not possible with the set up that I am at right now. Any advise or websites that will be able to help this dumb hammer would be great. Thanks.

You are most likely getting this "TX ERROR" message because you are trying to transmit a signal on an invalid frequency.

73, Bill

Subject: [FT897] 897D (dog)

I have an 897D that is giving me fits. Is there a sequence that gives a complete reset of
the rig?

Here is the problems; It worked fine on HF. I talked to several of the locals. I worked it on
all HF bands. I saved some of the frequencies (HF) into memory. All seemed to be in good
condition. Then I went to 2 meters, selected several of the local repeaters, did all that is necessary to get them going. I talked to a couple of them with no problem. I put them into memory and they worked ok. But when I am in memory mode and turn off of the 2 meter repeaters to an HF frequency the radio keys up. Go back to a 2 meter frequency and it is fine. Then I go to VFO mode, a or b, and attempt to change the frequency and the VFO dial does not work. It turns but there is no movement of frequency. I have no idea what I have done or what has happened to the rig. Any help would be appreciated.

From: Jim Coon
Topic: 24499 Message: 24503

can you put some radials on the base of the ATAS120? That might help to have some tuned to 40m. I was able to get my ATAS 100 to tune to forty by mounting it on a bed frame and then touching up the tuning manually using the [UP] [Down] buttons.

A vertical antenna uses it's reflection against the ground plane to complete the other half of the wave, so try running at least one wire from the grounded part of the antenna mount I'd try making it as long as the antenna. The more the merrier too. but use at least one.

You do know that on two meters FM the little mem/vfo knob does the tuning on 2FM? The big knob doesn't work. You have to read the book two or three times before you turn the radio on. It cuts down on the frustration. Hope this helps.

24509. Power problem?

Yahoo group: FT897 (2009)
Date: 2009-01-03 15:27:13 UTC
From: Tom
Topic: 24509 Message: 24509

I just received my 897D from HRO yesterday. I also ordered and received the internal power supply as well. I installed the internal power supply, connected a small portable whip antenna (for listening purposes only)and plugged the rig into a grounded three pronged wall outlet to see if everything worked. Note*** I did not transmit only used the receiver. Although the rig turned on...after about ten minutes the rig suddenly shut down. I tried shutting off the power button on the radio, shut off the internal power supply waited a few minutes then tried turning everything on again. Still dead. OK...I unplugged the molex chord, reseated it, unplugged the power chord and reseated it again, turned everything on in proper sequence and it seemed to work fine.
Now, maybe it simply was just a matter of poor connections. Maybe not?
Anyone else had this problem?
I certainly will be checking this again today BUT I just wanted to check with folks here and see IF anyone else has had this problem and/or if this is simply my doing something too soon without reading the manual.
Thanks in advance for your replies!

If you read the manual, you will see that the batteries are shipped uncharged. Plug it in and leave it alone for 16 hours or so.

If you read the email you will see that he has the version with the internal power supply so there are no batteries to charge!

If you read the manual, you will see that the batteries are shipped uncharged. Plug it in and leave it alone for 16 hours or so.

Hi Lee.
Thanks for the prompt reply but I am not using the batteries. I have installed the Yaesu internal power supply. No batteries to be charged at all.

Sounds like a poor connection; now fixed.
But check Menu # 7 -- auto power down.

Take a look at DXLab, which is free. Besides the usual logging, FT-897 transceiver control, DX spot collection and digital mode features you'll find in most applications, DXLab

- directly prints QSL labels and 4-to-a-page QSL cards

- directly prints addresses on envelopes or labels

- tracks confirmation and verification of QSOs for DXCC and TopList awards, highlighting needed DX spots, automatically generating outgoing QSLs that request confirmation of needed QSLs, identifying confirmed QSOs for submission to the ARRL DXCC desk, and generating DXCC submission paperwork

- reports progress towards DXCC, TopList, Challenge, VUCC, Marathon, WAS, WAC, IOTA, WAZ, WPX, ISA-CA, DOK, WAE, RDA, JARL, and WAB awards

- extracts address information from all 3 CDROM callbooks and QRZ.com (no advertisements for subscribers, with advertisements for non-subscribers)

- provides operations that can alter many logged QSOs simultaneously without requiring the user to modify ADIF files -- e.g. performing callbook lookups on already-logged QSOs, or adjusting the start times of QSOs logged during a specific time range, or extracting QTH information from COMMENT fields, or...

- synchronizes with LotW and eQSL.cc, initiating upload and download operations with a single mouse click without requiring the user to manually invoke TQSL

- provides one-click access to more than 80 web-accessible sources of QSL information

- displays frequency-dependent settings for devices like tuners and amplifiers

- provides both map-driven and callsign-driven operation of all known PC-controllable rotators

- captures DX spots from up to 6 sources (telnet clusters, packet clusters, DX Summit), creating and maintaining a local database with one entry for each active DX station that is color coded by "need" and LotW participation, and whose entries can be independently filtered and displayed in a table, on its world map, and on a zoomable bandspread

- extracts QSX frequencies from DX spot notes, enabling accurate transceiver setup for split frequency operation with one user action

- captures solar and geomagnetic data from WWV spots and uses this data to display easy-to-understand QST-style graphical propagation forecasts, and to depict the auroral oval on its world map

- monitors user-specified NCDXF/IARU HF beacon schedules to rapidly calibrate propagation forecasts with actual propagation

- decodes all PSK31 or PSK63 or PSK125 QSOs within your transceiver's bandpass and extract callsigns to create and maintain a "stations heard" window

- simultaneously runs soundcard RTTY (using the MMTTY engine) and an external modem (e.g. a KAM or PK232) to provide diversity decoding or the ability to simultaneously decode a DX station and callers

- supports PSK, RTTY, CW (generation only), and Phone (voice keying) with a single user interface and macro facility

- interoperates with with MultiPSK, MMSSTV, MMVARI, MMTTY, MixW, Fldigi, DM780, HRD, and DX Atlas

- is updated frequently, and downloads/installs upgrades with a single mouse click

- is driven by an active and friendly user community open to everyone

The DXLab Suite is available via http://www.dxlabsuite.com/

The only time I had problems like that were when I didn't have the proper antenna and I tried to transmeit or the plug wasn't connectd properly. If it happens again check the plug first there could be a bad connection inside in the cord. You might want to take the power supply our and put it back jsut to be sure. If you are going to turn the radio on without the proper antenna disconnectthe the mic to be sure you don't hit it by accident. KD5LBE 73

If you want a logging program you need N3FPJ Software Package. It is the most common one that I know of and it is pretty cheap and avery good.

24520. FT-897D UK Version

Yahoo group: FT897 (2009)
Date: 2009-01-03 23:57:08 UTC
From: dave.stockton
Topic: 24520 Message: 24520

Hi Folks,

I'm new to this site so please forgive me if this question has already been answered. I have a new FT-897D, brought in the UK but like most other things, made in Japan. What i want to know is, is it possible to do the jumper settings on a UK rig to make it work "freeband". ie. transmit and receive off the amateur bands?.
The only info i can find go's back to 2004 and i'm not sure if it is still valid today.

Many thanks,

Dave S

From: Daphne Neal
Topic: 24509 Message: 24521

Hi,

I have had my FT-897 since September and on several occasions it has appeared dead, a quick wiggle and push on the power cord to the Internal power supply seems to solve the problem. Whenever I move the rig now, I always give the plug a push and I everything works okay.

24524. auto noise

Yahoo group: FT897 (2009)
Date: 2009-01-02 06:59:15 UTC
From: Lew
Topic: 24524 Message: 24524

Hello from South Australia.
I have been using the rig + tapped whip, mounted to my roo bar of a toyoto prado. I am not using while mobile, only parked at high point, from home, but I have noticed a noise that increases in volume and then dies down but returns and goes through same cycle. I am running from a seperate gelcell 12 volt. I think it may be the security system on car.

The ignition is off during use. any ideas, answers very much appreciated.

24525. LDG Z-100 or AT-897

Yahoo group: FT897 (2009)
Date: 2009-01-02 08:58:51 UTC
From: Daniel Dibbets
Topic: 24525 Message: 24525

Hi,

I'm going to buy a FT-897D with the FP-30 power supply in a couple of weeks (If someone is selling a clean set, please let me know). I'm still wondering what kind of tuner to buy.
I already have the Z-100, which I can connect to the ACC port on the 897. Downside is that the Z-100 cant be nicely bolted to the 897s side. Upside is the wide tuning range on the Z-100
I'm also considering the AT-897, which connects to the CAT port if the 897. What does this give me more that using the Z-100 connected to the ACC Port? The AT-897 gives me the same wide tuning range as the Z-100.
Last option in the consideration is the FC-30, which bolts nicely to the 897, tunes from the 897 and looks very nice with the radio. A major downside is the small tuning range, therefore this one is currently the last one on my list.
So what does the AT-897 give me over the Z-100? And how does the Z-100 work with the connection to the ACC port?

Thanks and 73s
Daniel AF6FZ

Give MORE detail! What BAND (s) do you hear the noise on, do you also hear it if you park somewhere else, at least 5 Km (3 miles) away) from that site? What equipment is in the auto, such as GPS , AM/FM radio, TV, CD player, DVD player, Cell Phone, etc? Try turning these devices fully OFF, or remove the batteries, one by one. (Remember: Cell telephones transmit a "Here I am" locating/identification signal at regular intervals, any time that power is available to them, regardless of whether you are calling/talking or not! I hope this helps! 73, KC3VO, Bob Curry

Topic: 24520 Message: 24527

The dealer you bought it from should have the info or be able to do the mod for about a tenner or so. ML+S opened up my FT-857D a couple of years ago as it was the only way to cover the 7.1-7.2MHz allocation. I doubt that the jumpers have changed since 7.2MHz became standard so that 2004 info is probably correct (no promises) but the mods.dk website may help. Don't forget to do a full reset as described in the manual at the end of the procedure to make the rig re-read the jumpers and you'll have to reload any memories afterwards as all settings are lost.

Check back on this and the FT-857 lists for comments on the wisdom, safety and legality of using it outside the amateur bands though.

Subject: [FT897] FT-897D UK Version

Hi Folks,

I'm new to this site so please forgive me if this question has already been answered. I have a new FT-897D, brought in the UK but like most other things, made in Japan. What i want to know is, is it possible to do the jumper settings on a UK rig to make it work "freeband". ie. transmit and receive off the amateur bands?.
The only info i can find go's back to 2004 and i'm not sure if it is still valid today.

Many thanks,

Dave S

Topic: 24525 Message: 24528

The AT-897 is by all accounts simply a Z-100 in a more convenient package. Consensus is that it tunes way better than the FC-30. Note that the AT-897 tunes via the ACC port like the Z-100, it merely uses the CAT port for power, so it saves tangle at the back of the table.

The beauty of the AT-897 is that once attached you can treat the rig as one lump for transport, and you are going to move it about aren't you, otherwise you might be better off with a FT-450 and a FT-7800 (unless you need SSB on UHF/VHF).

Tip: if you go with the AT-897 and you carry it about pop a couple of cable ties round the three cables as the CAT cable can pull out and possibly the ACC cable too whereas the PL-259s are locking. Don't bunch the three together because of the power in the antenna jumper but put one tie round the CAT and ACC cables and a loose one from there to the antenna cable.

Tip2: when mounting the AT-897 take the opportunity to make sure the SO-239 connectors are done up tight as some people (myself included) have found the antenna socket coming loose after a fair bit of use.

Subject: [FT897] LDG Z-100 or AT-897

Hi,

I'm going to buy a FT-897D with the FP-30 power supply in a couple of weeks (If someone is selling a clean set, please let me know). I'm still wondering what kind of tuner to buy.
I already have the Z-100, which I can connect to the ACC port on the 897. Downside is that the Z-100 cant be nicely bolted to the 897s side. Upside is the wide tuning range on the Z-100
I'm also considering the AT-897, which connects to the CAT port if the 897. What does this give me more that using the Z-100 connected to the ACC Port? The AT-897 gives me the same wide tuning range as the Z-100.
Last option in the consideration is the FC-30, which bolts nicely to the 897, tunes from the 897 and looks very nice with the radio. A major downside is the small tuning range, therefore this one is currently the last one on my list.
So what does the AT-897 give me over the Z-100? And how does the Z-100 work with the connection to the ACC port?

Thanks and 73s

Hi Dave
I have the 2006 (UK) Model FT897D,
I opened up the TX/RX as per the Mods DK, instruction.
Ihe links are " TINY", so if your eyesight is same as mine from years of
screen searching, do use a magnifier, and a verrrry fine soldering iron.
The melt temprature of modern solder is much higher than the old
lead based solder, so you need a temprature controlled Iron.
The mod will open up everything exept the FM musuc radio band.
I have just found one anomily.....
My TX power on VHF is stuck on 36 Watts into a dummy load,
and the 100Watts on HF is stuck on 100. ???
Any comment from the group on this appreciated ???
best wishes for a prosperous and healthy new year to all the group.

Daniel, I currently use a Z100 with my 897 and am quite pleased with it. A push of the button tune the rig and I'm off and running. As I understand it the AT897 is essentially a Z100 recanned to bolt on the rig. It uses the cat connection to get power and will pass cat through for rig control you still connect the ACC cord for tuning. What you get is a bolt on tuner that isn't quite as "pretty" as the Yaesu version but has a wide range.

Hi Dave

I have a 897 and its was modified to do exactly that. The mod was carried out in about 5 mins by the vendor I bought the radio from via some soldered jumpers inside.

He did tell me that he had seen units that had been modified to do the same but via a different firmware being uploaded rather than jumpers. The result on some newer models though was that it corrupted the firmware which meant a trip back to Yaesu to be fixed. (probably expensive also).

I'm using the Z-11 Pro with my 897. It works great. I selected it because that leaves me free to use it with other rigs if needed. And it's so small that bringing it along on trips is not an inconvenience, at least for me.

Just as is true for Curt (KC8STE) with his Z100, I've found tuning to be push button simple. I hear great things about AT897 and the Z100 too so it would be hard to pick the wrong one.

The Z-100 works great with the FT-897D, Daniel. I'm totally satisfied with the performance of the tuner. I'm still gonna get an AT-897 for at least one of my 897Ds just for the grab and go convenience, but there are no performance problems with the Z-100.

BTW, avoid the FC-30. A friend of mine has one and is getting ready to get an AT-897. FC-30 just doesn't have the tuning range. But it is aesthetically pleasing...

Hi Josef,
I may presume wrongly, but I think the EU version (FT897D) should be
similar in band to the UK Model !
As I said in my last post to Dave, I opened up my rig for full RX/TX.
The strangest thing, I just found while checking out Top Band on mine ,,,,, to check your info...
Top Bans starts at 1800 Kc and has tx/rx facility on that Tuner knob right up to 7000 Kc. ... and above.
The strange thing is this is now on the 40M band, and when I click back on the band change from this position, instead of having the 70 cms. band displayed it reads 1.8 MHz (1800Kc) ,
If I click back another band change, I am mow truly on the 70 cms. band.
Yes the band does start at 1800, as below that you have receive only and to key the mike (AM) there is no RF out, and the " TX ERROR " displays..
I opened up my rig to have TX on 5 Megs, as I just have this licence before Christmas....
I now find I have an extra " band slot " as I have 160M, 80M, 5 Megs continuous, 40M, 20M, ect....
I asked here a couple of times in caution before the "band opening", and was assured all rigs were the same for the MOD, it certainly works, but it sure is strange.....
I hope this helps

Use TXGND and GND. "GND" would be the pin that connects directly to the FT-897 chassis ground. These connections are used to activate an external linear amplifier, by providing a DC path, for low-voltage DC relays in the amplifier. Do not use, if your amp has High-Voltage keying, like the SB220, SB221, SB200, SB230, or the old DRAKE amplifiers! Most modern solid-state amps key directly without problems, as do many tube amplifiers of less than 15 years age. (if in doubt, MEASURE the keying voltage, if less than 50 volts, and DC+polarity, it is likely to be ok.) 73, KC3VO, Bob Curry

From: Jim Coon
Topic: 24538 Message: 24540

From the manual:

The rear-panel CAT/LINEAR jack is an 8-pin, miniature
DIN type, with the ?TX GND? pin providing a closure to
ground on transmit, for T/R control of your linear amplifier.
The ACC jack is a miniature stereo type, with external ALC
input capability on the tip connection. The main shaft is the
ground return. The ring connection of the ACC jack, when
closed to ground, places the FT-897D into the transmit mode,
and sends a steady CW carrier, for amplifier (or antenna
tuner) adjustment purposes.

This 8-pin mini-DIN jack is used for connection to the
FC-30 External Automatic Antenna Tuner or ATAS-100/
-120 Active-Tuning Antenna System. It is also used for
interfacing to a personal computer for control of the transceiver
using the CAT system, and for interconnection
to the VL-1000 Linear Amplifier.

Hi Group,

Not had any luck with my previous post. Am rephrasing the earlier query hoping for some advise from seniors on this group.

I'd like to cover the full 136 to 174 MHz range Tx/Rx on my recently accquired first ever 897D.

A modification I tried took it up to 163.999.

But, how do I get up to 174 MHz? One of the car cross-country rallies we provide communication support for is licenced above the 164 MHz limit.

Hence, this request again.

Many thanks in advance.

Hi Lew,

Do you have a cell phone on charge at the same time - Both Nokia and i-phone do this to me while charging.

The mic jack pinouts are on page 12 of the 897D manual. If you don't have the manual, contact me off-list and I'll email you a PDF.

There is more than ONE schematic version for the FT-897 or FT-857. Main differences are in the R.F. output/final amplifier stages, early units used BIPOLAR, NPN transistors, and more recent radios use MOSFET transistors. These devices are NOT directly interchangeable, as the input BIAS requirements are drastically DIFFERENT! Be sure that the schematic applies to YOUR radio, so as to avoid causing damage by improper parts or adjustment.--73, KC3VO,Bob Curry

24559. Internal Batteries - Charging while using the radio

Yahoo group: FT897 (2009)
Date: 2009-01-09 02:50:59 UTC
From: kybarney
Topic: 24559 Message: 24559

Hi,

I have a quick question. I have the internal batteries from W4RT. I have not used them but plan to this weekend. (for the first time).

I am going to be going portable from a hotel room and was wondering if I can charge the idle battery while using the other battery? Will that damage the radio? The manual does not address this...it says you can charge the battery in the radio but does not say if you can use the idle battery while charging the spare battery....

Any help is appreciated.

Thanks and 73,
Kyle N9NJM

24560. Re: [FT897] Internal Batteries - Charging while using the radio

From: Brandon Cruz
Topic: 24559 Message: 24560

Kyle, when using the batteries only one is 'connected' to the radio at any given time (via the A/B rocker switch on the top of the rig). Also, since the batteries have independent charge connectors. Therefore, when operating on battery A you can charge battery B which is effectively disconnected from the radio and thus there is no impact to the rig. Once battery A is depleted you can switch to battery B and then move the charger to battery A. This 'independence' of the batteries makes it quite convenient for charging in the field (with a solar panel, for example) as one could operate indefinitely simply by alternating the charge and use cycles.

Thanks for the response. If you accidentally were to switch the A/B switch on to the battery that is charging, would you fry the rig?

Also, do you have a recommended solar panel/charger for use in the field? I would be very interested in purchasing one...

Thanks again for your response.

Kyle

Kyle, I've switched back and forth while charging and haven't seen a problem. That being said I don't think it's a good idea to run the rig on the battery being charged due to the higher than normal voltage.

I don't have any specific recommendations regarding solar panels as I haven't much experience with them. One place you might look for some models is Harbor Freight (http://search.harborfreight.com/cpisearch/web/search.do?keyword=solar) but I'm sure there are many sources. Others in the group may have better information than I.

Thanks for the response. If you accidentally were to switch the A/B
switch on to the battery that is charging, would you fry the rig?

Also, do you have a recommended solar panel/charger for use in the
field? I would be very interested in purchasing one...

Thanks again for your response.

The HF panels are fine, but the controller is garbage. Get a Xantrex C12 (preferred) or a Morningstar Sunguard. If you're in hail country, I prefer the Uni-Solar US64 panels. They're amorphous and can be penetrated by hail and still function which crystalline panels cannot.

See: http://wedothatradio.wordpress.com/2008/04/11/green-radio-we-do-that/

for a video of two US-64s mounted on my pickup.

What do you want to know or need to know. Are you attempting
to decide between the two?
The FT-950 runs circles around the FT-897 with the IF DSP
and other features. The FT-897 is a great rig. Good radio
for the price plus you can take it to the camp or on
holiday. The FT-950 is more advanced and not very portable
it will out perform the FT897. Like a Ford Ranger pickup and
a Ford F-250 they are both great truck it just depends on
what you need. Both are a very good deal and have
aftermarket value in the ham radio world.
A nice antenna system and an FT-897 will out perform an
FT-950 with a basic antenna.

I think, for most of us - me anyway - the 897d is a second rig, not a primary. You could get by with it but the virtue of an 897d is all the things it can do, the size and the ability to operate portable. If I had just one radio, it would not be my choice. But I am delighted with it as a second (or third) rig. It is surprisingly adequate and does a useable job when I'm operating portable.

And it's done a fine job for me whether I'm in a cabin in Nova Scotia or a hotel room in Pittsburgh.

But - and I agree with the N5ZTW post. You'd find that the ft-950 is much better for a main rig in your house. Don't get me wrong, the FT-897d is terrific for what it does and I sure wouldn't part with mine. I bought it with low expectations and it has easily surpassed those.

But, as far as HF performance, my old TS-830S would run circles around it and my Pro III leaves it in the dust. On the other hand, if I need a grab and go rig to operate portable from a cabin or a hotel room - it's the champ.

Why you need it or why you want it.
Cover up the price tag and then decide.
897 is a good portable rig.
FT-450 is a better shack rig.
FT950 is good if you have the money and know how to use all the features.
If you are a newbee get the cheaper one and learn to use what it has.
Has more than you need anyway.
If you cannot decide ,you are not ready for a 950.
Dale

I agree with the other postings, but if you need the 2 meter and 70 cm bands it is the radio to get. It is also my second radio and I use it as much for listening on HF and working 2 meters as I do for working HF. KD5LBE

I have had the PA-26 wall charger connected to the CD-24 controller and it charging the idle bat. while I'm using the other bat. and found there is no probem on fm mode but much too noisy on ssb. Is there anybody else who has experimented with this particular setup?

Hi All, I've had my 897d since 6/30/08 and it has shut down 3 times while transmitting. Need some advise.

Equitpment list:
FT-897D
Astron RS-35M P/S
AT1KP Palstar 1200W Tuner
40 Meter Multi-Band TAK-tenna
50' 9913F Belden coax
6' copper ground rod

A mounted buse bar that has each piece of equiptment grounded to it (seperatly) and then a 6 foot 12AWG ground wire going to the copper rod.

I understand the 897D has a protection curcuit and will shut down if something is out of spec. I also think the Astron P/S has a "Crow-bar" protection circuit in it. I was told by another Ham that if the amps drop to low for what ever reason the P/S will shut down the 897D?
The SWR is 1:2:1 (Reading taken from MFJ-259B analyzer) and same at the tuner. My coax goes thru the tuner because I use it to tune SWR for other Freqs.
The main circuit box has a 25 amp fuse and the only thing on that circuit is the 897D and the P/S.
When the 897D shuts down, I turn the P/S off (which is still on and the amps meter shows 0 amps which I think it should. I did not note the volt meter, but will if this happens again. When I turn the P/S back on, first then the 897D it comes back to life, thank the almighty.
Any ideas what is causing this???

how far away is your antenna? If RF gets onto the DC power leads, it can activate the power supply crowbar circuit. If you have the ADJUSTABLE supply, you could have the current limit set too low, nor a voltage set outside the 13.0 to 14.5 volt ideal range. Antennas mounted close to the equipment, or worse yet, INDOORS, usually cause many problems! If you care to call me, I will make further attempts to assist. Phone is: 301-439-3873. KC3VO, Bob Curry

Thanks Bob, My antenna is on the other side of the garage from my station (approx, 20') and then it is on the roof 25' from ground. The P/S is adjustable, but why does it work 99% of the time? The setting is as it came from the factory. When I stated the volt meter show 13.8 to 14v, I was wrong, I just re-check and it is slightly above 14v, so it most likely is closer to 14.5v.

Did you read what Customgraphics said? He said he had the same problem until he bend the pins on the 6 pin molex power connect so it had a tighter fit. I,m not sure how to adjust the voltage if it is to low, so might give you a call. Thanks for your help.

Topic: 24559 Message: 24577

Hi all.

This may have been asked before but I couldn't find the info anywhere so..

what spec is the panel meter required to construct an external meter for the 897. Ie FSD current etc.

I've been prompted to do this by the face prints available in the download area.

Any help greatly appreciated

Scot

Topic: 17411 Message: 24579

Hello All,

I am new to the group, and as of tomorrow I will become "official".

My "internal" power supply arrived today and my FT-897 will be here tomorrow!! By the end of the day on Friday everything should be here, everything I've ordered so far that is.

A FT-897 with internal PS. A LDG Z11 Pro and LDG Balun. A Daiwa SS-330W. A Buddipole Deluxe with long mast. A K1-4 kit. I think that's about it.

I do have a couple of questions for the group. How do you know whether to use a 4:1 vs a 1:1 balun? I am also planning on getting a couple of small 12v gel cell or sealed lead acid batteries, something around 7ah, anybody got any recommendations? I'm also thinking about putting a slinky antenna in the attic at least until the spring thaw ;)

I look forward to reading through all the great info/advice on the site.

24580. FT-897 ALC and Digital Modes

Yahoo group: FT897 (2009)
Date: 2009-01-10 00:34:45 UTC
From: ab8xx@rocketmail.com
Topic: 24580 Message: 24580

Hello,

I recently started working digital modes more and think there could be an issue. Setup is an older FT-897 with a Panasonic CF-18 Toughbook (with mic and headphone jacks only) with a Rigblaster Plug&Play to the DATA jack on the back of the radio.

The manual calls out adjusting the input audio signal for about 7-8 dots on the display. I adjust it for about 3-6 units on the meter so that overdriving the TX does not occur. While testing a PSK31 signal into a dummy load, I noticed that from band to band, the ALC level seems to change in strength even though the amount of audio feeding the radio had not changed. This is just with a blank PSK31 signal with no characters sent. Modulation is full scale. People tell me that I look good and clean on the waterfall (with only about 1 "unit" of ALC on the meter). Why would it fluctuate? It seems you would have the same amount of ALC all the time from band to band because it goes to the balanced mixer.

Another issue I have noticed is that when setting up the audio levels at 5w (I operate with the lowest power I can), adjusting audio out from the computer to the radio can be tricky with the ALC. Only increasing volume by 10% on the laptop causes it to jump from 1 unit of ALC to about 9, with no medium in between. When you increase the RF power out of the transmitter, it seems to throw off the ALC setting.

I have not seem to have had as many issues with my FT-817.

It seems crazy that I would have to change the AF drive to adjust ALC whenever changing bands or RF power out on the radio.

Are "dots" on the meter "one" vertical bar, or "one unit" like an s-unit?

Any ideas?

Thanks,

Ryan AB8XX

From: John Dennett
Topic: 24582 Message: 24582

Hi all,

I'm a recently upgraded general, so I'm getting used to HF in general, as well as the FT-897.

I'm using the LDG AT-897 tuner, and have output to 2 different antennas, Hustler 4BTV, and a G5RV-jr in an inverted V peaking at about 20ft. I can't improve much on the antennas because of where I live.

I have just started tinkering with the DSP, and am looking for where the group feels the best settings are for SSB on the 897.

Thanks

John-N1XHZ

From: abiqualumber
Topic: 24583 Message: 24583

I am currently reading the manual of my recently acquired FT-897D. I will have to wait for the snow to stop before I can go outside and erect an antenna. Therefore I am gathering up all necessary material and knowledge in preparation for getting on the air.

One item I will need is a very good AT that is compatiple with the rig and easy to use. Initially I will be utilizing an end fed long wire. What are my options?

Easy to use, looks good with rig and works great with end fed wire antennas. Suggestions please.

Thank you in advance, 73 de Bob n7doc

For an end-fed LW, this is probably your best bet.

http://www.universal-radio.com/catalog/hamhf/06431897.html

When you get to a coax fed antenna, you'll want the LDG AT-897, not the Yaesu FC-30.

A 7 Ah battery isn't going to last very long. You'll need to consider how long you want to be independent of the power grid and calculate your necessary battery capacity from that. For a short grid failure, 7 Ah might get you by. For longer than "short", it ain't happening.

If you're looking to be useful in EmComms, it's nowhere near enough. Email me offlist if you'd like and I'll help you size your battery bank for what you want to do.

I don't know if you're talking about the TX or RX settings of the DSP.
The best way to set the TX is simply to make an adjustment and ask for
an on-air critique of your transmitted audio. Your fellow hams will
point you in the right direction to the best sound.

For your RX settings, it's simply what sounds best to you.

Enjoy the radio. I have two of them and think they're the neatest thing
since canned Guinness.

Whatever works for you. I'll admit to being a bit cynical since all our radios now are just computers with a couple RF stages attached in loose formation.

Back in the 60s and early 70s, I built a lot of kits and a few projects from scratch, but I've gotten away from it now since I haven't kept up with the latest advances in solid state electronics.

That's my fault, no question, but sometimes I miss the old Heathkits with the "hollow state" devices in them.

For about $70 the battery from battery space

https://www.batteryspace.com/index.asp?PageAction=VIEWPROD&ProdID=2205

has the same rating, 13.2 v, 4500 mAH, as the stock Yaesu battery and
it comes with a charger.

The difference is it won't fit inside the rig (unless you take it
apart), and you have to make up a plug for it.

I put up a slinky down the hallway on the second floor and was able to
check into ECARS and the Waterways net and have a QSO with W1AW from
Detroit, I had to use an antenna tuner and I streached the slinky about
10 feet and added about 10 feet of wire to each end. I wil be glad
when I can get an off center fed dipole (windom) installed. HOping the
weather will break soon.

Filter as little as possible. Add filtering to make it less tiresum to
listen to and to remove annoying QRM and QRN

There are 2 ports on the radio and if I remember correctly, the port to program is NOT the same as the one for computer control. Make sure you are using the correct port AND cable!

Subject: [FT897] Ham radio Deluxe useing the ct-62 cat cable

For some strange reason the program will not allow me to connect to
the the radio?
i have adms programming software and it works fine.
I had tried ever configuration on the settings on the ham radio Deluxe
program..with no luck..
If anyone has any Ideas Please let me know!!

Thanks

The ports are the same for Rig control and programming of memories etc - CAT port. No Change there. Check your settings in the Programming software and make sure you are set up with the same settings in HRD. If you can connect with one, connecting with the other will work.

Hi Ryan,

I've noticed this as well, even within a band, the volume coming out of the computer needs to be adjusted whenever you change locations on the waterfall.

You really have 2 options ...

1) Get a PSKMeter http://www.ssiserver.com/info/pskmeter/ which automatically adjusts your soundcard as you send data.

2) Manually watch an external meter, like the FTMeter http://www.ldgelectronics.com/products.php?cID=3&pID=16&v=1 which is easier to read/understand than the onboard digital meter (which is very poor IMO).

With your other problem at very low power, I typically don't run that low, so I'll defer to others.

24604. Re: Filter settings

Yahoo group: FT897 (2009)
Date: 2009-01-11 23:29:54 UTC
From: chameleon_antenna
Topic: 24582 Message: 24604

Good afternoon John,

Congratulation for your General upgrade! I will do the same this week.

Concerning your antennas "problems": Like a lot of people getting into HF, available space for HF antenna can be a real problem. A lot of factors can disturb the quality of your TX/RX: power cable/line, other electrical equipements, etc... I personally don't have a lot of space where I live. So for me a 51 ft. dipole was simply out of question!

So I've decided to get a vertical 8.5 feet high CHAMELEON V1 HF Multiband Antenna☐ <http://alexander.the.hard.googlepages.com/home> . This is a 10 bands antenna that also works on 70cm and 2M. That come with a little device, a balun 9:1, which help to remove noises and improve the SWR. So to find the perfect location to setup my antenna it was MUCH more easier to move my 8.5 feet antenna to the perfect location by trials and errors that it would be with a 51 ft. dipole.

Now back to the Ft-897: No real perfect setup exist for SSB. But here some tricks that I found by experiencing with it.

* If your signal is weak but not fading use the DSP - DBF.
* If your signal is weak and fading use the DSP - DBF and use the Clar setting (bottom right of your Ft-897). To keep a good reception you will have to follow the signal fading by constantly tuning the Clar knob.
* If your signal is strong but very noisy use the DSP - DNR and sometime the DNF at the same time.

I hope that this will help.
For more informations about the CHAMELEON V1 HF Multiband Antenna☐ go there:

Hi Scot

I made a meter in a box with the face print. The meter is rectangular and the face print just doesn't fit exactly as my local club members tell me. (jealousy?)

The box was abs from maplins and is almost as big as the rig - meter 6" by 41/2" by 21/2 " deep and the box 81/2" by 5" by 3" and it cost a lot more than the salvaged 500 micro-amp meter from a rally.

For £10, I have a fine looking easily readable multi purpose meter - the shunt worked out to be 100 ohm as I remember and gives full scale on FS from the radio.

A few comments...

DBF is a Band Pass Filter. It rolls off signals above and below the settings. Good starting point is 300 Hz and 2600 Hz. Alter to suit your ears, there are no wrong settings. Experiment until it sounds good.

Clar is clarifier. This is useful for temporary, small frequency shifts to the receiver. Say you're in a round-table discussion and one station is off a bit off frequency, adjust the clarifier for best voice quality. The benefit is the transmit freq stays the same, so the group doesn't keep retuning. It does nothing for a fading signal.

DNR is Digital Noise Reduction. Useful at almost all times. Turn it off to hear what a radio sounds like circa 1990.

DNF is Digital Notch Filter. This reduces the annoying tune-up carriers and other narrow-width signals. It should be off for CW, digital modes or music.This has an adjustable setting also.

From: Steve Yates
Topic: 24580 Message: 24610

Ryan,

I suspect that the internal adjustments of the radio that set the power output (ex., max. 100 W) do so by adjusting the ALC level. Since the total system gain in the transmitter can vary from band to band the point at which the ALC is activated also changes. Without an ALC circuit the rig's maximum output would change from band to band. As you noticed, at 5 W the ALC becomes pretty touchy, probably because a large amount of ALC is used to limit the power. Once I have things set up I find that I only need to adjust the Digital Gain on the radio from band to band or different power levels to keep the ALC from activating. I can keep the computer's output the same.

I always make sure that at whatever power level I'm using that no ALC is indicated while in the digital modes. ALC indicates compression which distorts the audio waveform and increases the bandwidth. For SSB this is okay but it is bad for the digital modes. I don't find on the air reports very useful anymore since I've seen folks give excellent reports to stations that were as wide as a barn door. A particular XE station on 20m PSK31 comes to mind ;-)

73,
Steve - AA5TB

Thanks Lee and Steve.

I may end up getting one of those FT Meters from LDG. That would probably help some and make using the radio overall better.

>Once I have things set up I find that I only need to adjust the

I like that idea and will give it a try. A while ago I used a Kantronics KAM for HF digital and used to adjust the rig's digital gain for it (but was probably still over driving the rig because I was going by the manual hi hi).

Thanks for your help!

If you have a multi meter, they usually have milliamp scales on them so
you can read the output and find the max before you bu a meter.

I cannot begin to tell you how much I like my LDG AT-897... like
Forest Gump says, "Well, that's one less thing to worry about."

It is very simple to operate and quickly tunes up, for me, everything
but the 160 meter band. I have a multiband dipole, the longest legs
are 60' each side for 80 meters. It won't tune that on 160 meters.
but everything else, a push of the button, ZzzzT!, and it's good to
go.

The next worst band on my antenna is 12 meters, 5:1 SWR, and it
easily tunes, that.

Excellent choice.

New to HF and fairly new to the 897D. Have mostly used it on VHF-UHF and only now am working my way through HF.

Operating USB on 20 meters, I get a shift between receive and transmit frequencies. Obviously I need a shift when operating through in VHF-UHF through a repeater, but obviously don't when operating simplex on 20 meters--or any other HF frequency.

How do I disable the shift function so I transmit and receive HF on the same frequency?

I am sure the answer is perfectly simple, but for the moment it has baffled me.

> are 60' each side for 80 meters. It won't tune that on 160 meters.

(snip)

I have a 1:1 Choke Balun (aka "Ugly Balun") with 17 turns of LMR-200 on
4" pvc pipe.

Antenna is a multiband dipole with 58' legs for 75 meters, 32' legs for
40 meters, and 16.4' legs for 20 meters. It tunes up on 17, 15, 12,
10, and 6 meters.

I'm thinking of adding another segment for 160 meters with coils in the
middle of each leg.

24620. Suggestions for a HF (mobile) vertical

Yahoo group: FT897 (2009)
Date: 2009-01-13 12:33:58 UTC
From: tisle3000
Topic: 24620 Message: 24620

Hi all! I am a new and happy owner of an FT-897D. Now, what would you recommend for an HF vertical that would withstand heavy winds and would not need to be guyed? I can only install a vertical antenna on the roof of my my base station, and the antenna cannot even be guyed, which probably rules out the longest verticals on the market.

Furthermore, I would be happy if you could give some suggestions for a good HF vertical for mobile/portable use. I do not necessarily need tremendous multiband capability (20 m and 17 m being my favourite bands), but I definitely would like the vertical to be as efficient as possible, since I will be operating mostly on the FT-897D's internal battery power, which limits the output power to 20 watts.

Any suggestions?

73,

Ari - OH2GSY

Running FT-897. Connect to an AL-811 thru a ARB-704 Interface Buffer using the PNP-8M Cable to the cat/linear port on the FT-897.

Want to use Ham Radio Deluxe, interfacting to the computer with CT-62 interface cable.

Can't use the cat/linear port for both at the same time.

Have tried going direct from the ACC mini plug on the FT-897 to the radio connection on the ARB-704.....no luck.

Appreciate any suggestions on how to activate the AL-811.....thanks/73

How about Radials? Are those issues as well?

I'm using a Hustler 4BTV, but I know that they also have a 5 band
version.Had decent results so far.

I can't help on the vertical for mobile (I don't operate mobile) but for the vertical at your base station that doesn't need to be guyed, I am a big fan of antennas by this guy:

http://www.zerofive-antennas.com/

Great service and some of the most robust antennas I've ever seen. My 20 meter monoband vertical from Zero Five is so strong that you could dang near but a bea m on top of it, well dang near. (If you do go the vertical route at your home station, put out as many radials as you can and then add that many again, smile. But with enough radials a vertical holds up OK, especially over the long haul. I use a 20-meter yagi as a reference antenna to the Zero Five vertical (purchased before the yagi or frankly, I wouldn't have purchased the vertical), but it's there now so it stays. The yagi always blows the vertical away but - almost always - I can hear the station and work it on the vertical, just with a diminished signal.

I've also had good luck just building monoband verticals - use big enough aluminum tubing and they aren't going to go anywhere. I have a homebrew full-sized monoband 40-meter vertical and - again I used heavy tubing - it is unguyed and doesn't even notice heavy winds. And with a tuner, you can use it as a multiband antenna, although I don't go that route.

Yes you can all you need to do is to make you a split y cable like I did. I went to the local electronic store and got 2 inline 8 pin connector and 1 male inline 8 pin connector. then I split the wire that I wanted to go to the amp and the wires that goes to the cat interface. So I can now use both the arb704 amp interface and the cat cable and HRD.

The mobile TARHEEL antenna, model 200, will perform well in mobile or fixed, providing that you attach radial wires to its mounting/grounding base when used as a fixed location antenna. These radiail wires should be at least 30 feet long, and a minimum of 4 should be used, but more and longer is better. The Tarheel antenna will operate all bands from 3.5 mhz. to 54 mhz. (The antenna needs 12 volts to operate its tuning motor) This antenna is about 11 feet tall, with a large tuning coil. Bigger is better, do not use the smaller antennas, your transmit signal will suffer more! --73, KC3VO-Bob Curry

I took a 1/2 wavelength of wire and wrapped it around the house, attaching it to the gutters and shingles using the little clips that Home Depot sells for putting up Holiday lighting. I put the feed point at 36% of the length from the end and get low SWR on most bands using a 4:1 balun. It's a version of an off center fed dipole or Windom antenna, except instead of being in a straight line, it wraps 3/4 the way around the house. The wire can hardly be seen from the street and the cost was about $25 for the balun, $10 for the clips to hold it up, and I got the 16 gauge wire for Christmas. It works a lot better than the slinky I was using and better than the mobile antenna. You might be able to use that approach.

If you are looking for a good mobile antenna, atas 120 is a great antenna. I am having problems with it tuning on 40 meters and 10 meters but if all you are using is 20m and 17m it works great. I have had QSO with hammers in Florida and Georgia as if they were sitting next to me. I live in central Maine so it definately reaches out and touchs people. I have a unique set up so as soon as I have a permanent shack this antenna will have to do. I have it mounted to a metal post two feet into the ground, with a K400C. like i said it works great on 20m and 17m hope this helps.

New to HF and fairly new to the 897D. Have mostly used it on VHF-UHF
and only now am working my way through HF.

Operating USB on 20 meters, I get a shift between receive and transmit
frequencies. Obviously I need a shift when operating through in
VHF-UHF through a repeater, but obviously don't when operating simplex
on 20 meters--or any other HF frequency.

How do I disable the shift function so I transmit and receive HF on
the same frequency?

I am sure the answer is perfectly simple, but for the moment it has
baffled me.

If u want a great antenna without fooling around with radials check out MFJ-1786 or 1788 Hi Q loop. This is my first antenna and it works the same if not better than my small beam and my two dipoles. yes it is not a vertical but almost as far as mounting it. I just have it tied to a tree branch. As far as mobile look at Hustler with the different resonators and a mag mount base. You can put three antennas on one adapter so you can get band switching without changing antennas . Or another good one is any of the Outbacker antennas.

Good morning Ari. I use the Workman WHF75, 40 and 17 mounted with a rectangular piece of aluminum on my trailer hitch receiver. The bolt holding the trailer ball also holds the aluminum plate from the bottom side. I ran a short braid to a mounting bolt to provide a good ground as well as one from the rig to ground.
I also use the AT-897 tuner. A worthwhile addition is the WD4BUM Inducti-Match available from Lakeview Co. Inc.
The last point I would make, I use a piece of 20 lb fishing line wrapped around the antenna and looped over the ends of the plastic guard on the tailgate of my F-150 for support. This setup works great and cost under $250 for all that is described above.
73 and good luck.

Gordon,

No question is ever dumb...
The two suggestions here are the items to check (clarifier off, and split off), but wanted to expand on one thing since you said - "but obviously don't when operating simplex on 20 meters--or any other HF frequency." Many times HF stations when running a pileup operate on a different receive freq vs the transmit freq and that is the reason for those two options mentioned above (to be able to transmit on a different freq than receiving). Just wanted to pass on the little bit of background for you.

And, you know, it doesn't look near as bad on the radio as I thought it would. That may be because it's mine and on my radio <G>, or it may be because the pics on the LDG site aren't completely black and I was expecting something different. The unit is actually a dead flat black and matches the radio very well. The design ain't as pretty as the Yaesu FC-30, but it ain't bad at all. Or as my Irish friends say, "It ain't bad atall atall".

It's also faster than the LDG Z-100 it replaced. By about a factor of 2. Very quick tuning.

I'll give an updated report when I get a few QSOs on it.

24640. CAT question

Yahoo group: FT897 (2009)
Date: 2009-01-16 14:57:13 UTC
From: Jim Coon
Topic: 24639 Message: 24640

I am having trouble getting my computer to talk to my 897. I measured the voltages on the 8 pin connector and I get 13.8 volts on pin 1 to the ground pin. The Rx D reads about 5 volts and the Tx D reads about 5 volts. are these voltages correct?

I have menu 20 set to CAT and Menu 19 set to 38400. I've tried 4800 and still no connection to the computer. Tried the C-62 cable and a tinycat box. Same result. Any ideas what to try next?

I'm not familiar with the tinycat box. What does it do?

Are you connected via a real RS232 port, or using a USB converter? If the latter, may need to check the converter out. Might also check to make sure the data speed of the radio port matches what ever your PC port is set at. Also check to make sure the PC port is set to 1 start bit, 8 data bits, no parity bit, and two stop bits, as per the manual.

Hi Jim

I innitially had problems with my CAT control. Im using a USB / RS232 convertor and the issue I has was the com port assigned to the usb device wasnt compatable with in my case HRD and others, it cot assigned comm 14 or something like that.

The comm port number can be chaned in the driver on your pc.

I would imagine your radio is fine though.

Something else you could try is using hyperterm (if your using windows upto XP) and connect direct to the com port, you should i believe get some data coming back from your radio with S strenght etc I believe, (Im assuming this though as control softwares can recieve this data from the radio)

hope this helps

From: Bill Barron
Topic: 24639 Message: 24643

I assume you are trying to connect Ham Radio Deluxe software.

Check:

1) Cat plug securely seated in 897.
This is most often the problem.
Be sure to use 897 CAT port .. not DATA port.

2) Proper driver installed from CAT to USB adapter;
if you are using one. See drivers at
http://www.manhattan-support.com/en-
US/support/downloads/product/708-usb-to-serial-converter

Some USB/Serial cables don't work.
Manhattan and Radio shack do work.

3) PC baud at 9600 and 897 menu # 19 at 9600.
Don't go faster [creates 897 noise]
If really old PC, try 4800 on both PC and 897.

4) Don't rename PC serial ports
Make sure RTS box only checked on HRD software

5) 897 Menus:
a) #20 to CAT
b) #85 to OFF
NOTE: 897 must be on BEFORE you start HRD software!

Good luck!

Hi Gordon,

George KC0WOA has pointed out the 2 correct settings here. Just to elaborate, split is SPL found under menu `a' (one press of the `F' key) and rotate the 'MEM/VFO CH' knob till you get to menu 'a', it will have brackets round it if activated. The clarifier, if activated, will show an icon to the right of the frequency which can be a dash, an up arrow or down arrow.

Hope this helps.

Hi all! I am a new and happy owner of an FT-897D. Now, what would yourecommend for an HF vertical that would withstand heavy winds andwould not need to be guyed? I can only install a vertical antenna onthe roof of my my base station, and the antenna cannot even be guyed,which probably rules out the longest verticals on the market. Furthermore, I would be happy if you could give some suggestions for agood HF vertical for mobile/portable use. I do not necessarily need tremendous multiband capability (20 m and 17 m being my favouritebands), but I definitely would like the vertical to be as efficient aspossible, since I will be operating mostly on the FT-897D's internalbattery power, which limits the output power to 20 watts. Any suggestions?73,Ari - OH2GSY

Charlie,
The YF-122S can be installed in either slot 1 or slot 2; when it is installed in slot 2, you use button 'C' when the menu is displaying multi function row "n" choices. [see page 64 of the manual.]
The YF-122S has a resistor fitted to sense terminals on the filter carrier board so the radio circuitry can identify this as the SSB filter; the CW filter uses a different value of resistor to identify itself to the radio.

Good luck,
Frederick

24652. Antenna tuner vs. antenna analyzer

Yahoo group: FT897 (2009)
Date: 2009-01-17 00:38:45 UTC
From: willgord
Topic: 24652 Message: 24652

Hi:

In the early stages of setting up my first HF outfit--897D linked to a Super Antenna. I have no trouble hearing stations on 10 and 20 meters. Heard Italy loud and clear on 20 meters. Problem is that no one is hearing me.

One suggestion is to drop the counterpoise that comes with the Super Antenna and drop a quarter-wave radial out my window. The antenna is just inside my apartment window, mounted on a tripod.

I am getting high SWR readings when I transmit and I am getting two somewhat opposing sets of advice. One group says to get a tuner. No surprise there since I always assumed I would probably need one. I intend to get the LDG tuner that mates with the 897

But other people I have talked to tell me what I really want is an antenna analyzer rather than a tuner. Not sure I understand the difference.

Would anyone like to give me their best advice on tuner vs. analyzer to bring down a high SWR reading.

Thanks

Gordon

Gordon,

Analyzer will tell you SWR, impedence, capacitance, and some other info.
A tuner will (hopefully) tune the antenna to lower SWR and allow you to
xmit out. Both are good.

If it is one counterpoise, it must be the correct length for the band you
want to operate. You could try multiple radials "counterpoise" cut for
each band. You could try just laying them on the floor and out the
window. The more the better in any direction you can. Don't know if flat
4 or 6 wire cable is sold, but could cut each wire for a certain band. A
little bit nicer looking.
An antenna analyzer is nice to have, which I do, but it won't be much
help with a short vertical.
My apartment antenna is a square 5 foot loop inside a double window and a
SGC tuner. Tunes great. About 80 feet of zip cord is used in the loop.

My only problem is that after having a great DX station and now in an
apartment, I have lost interest and if I live long enough for the next
cycle I may get some interest back. After all, working 10mtr dx with a
wet noodle can be really fun.

24656. RE: [FT897] Antenna tuner vs. antenna analyzer

Yahoo group: FT897 (2009)
Date: 2009-01-17 03:29:53 UTC
From: Eric van de Weyer
Topic: 24652 Message: 24656

Hi Gordon,

The tuner and analyzer are two totally different things. The Tuner goes between the radio and the antenna feedline to help to overcome any mismatch between the antenna system and the output of the radio. It does not tune the antenna but rather provides an interface between antenna and radio so the radio sees the correct impedance at its antenna socket.

The analyzer, on the other hand, is a test instrument with which you can check the antenna and get a quantitative measurement of the antenna's characteristics at a particular frequency. It usually has a tunable RF source which is tuned to the desired frequency and then the characteristic impedance and SWR can be read off. Alternatively, you can tune it until it shows resonance and read off the resonant frequency of your antenna system.

As far as your antenna system goes, some sort of earth or counterpoise is essential for it to work, especially if you are using a small antenna inside a apartment. You need at least one for each band being used and they can simply be a piece of wire about 5% longer than a quarter wavelength for the band(s) in question. You could drop it out the window or even just run it around the edge of the room you are in, or down the hallway etc. They don't have to be in one straight line. If you can put in multiple wires for each band, then all the better.

73....Eric VK2VE.

Charlie,

Remove the top cover of the radio. With the front of the radio facing you look in the left rear corner of the unit & you should find 2 slots: one labeled FIL1, the other FIL2. Note that the filter has one end with a 3 pin socket & the other side with a 4 pin one. With the filter "writing side up" (printed circuit board down) orient the filter such that the 3 pins on the radio board align with the 3-pin socket on the filter board (and, the 4 pins on radio board align with 4-pin socket on filter board). Select either FIL1 or FIL2 and press filter board down onto radio board; ensure pins on radio board seat firmly into filter board sockets. Reinstall top cover (make sure speaker and battery switch are reconnected to radio board). Turn on radio, press "F" key momentarily to activate multifunction menu and select menu N (MFn). Depending on whether you placed your filter in FIL1 or FIL2 position the "B" or "C" button should have a display that looks like this: [2.3]. This tells you that the filter is installed properly and is set up for use.

Regards,

Mark (NM7L)

24659. RE: [FT897] Antenna tuner vs. antenna analyzer

Yahoo group: FT897 (2009)

From: Rob Salsgiver
Topic: 24652 Message: 24659

The analyzer will give you a picture of your antenna's performance at various frequencies. This will allow you to tune / modify your antenna for better performance. The benefit of this depends on the antenna being used - some antennas are designed for easier "tuning" by allowing minor adjustments that affect performance on a single band, or on multiple bands with a specific relationship between them (i.e. - changing one element may affect 10 meters and 20 meters). Sometimes the design of an antenna makes it difficult to change performance on one band without upsetting the applecart on one or more other bands.

An antenna tuner, on the other hand, is a device that, either manually or automatically, allows you to "tune" the antenna to your radio for the best SWR match available for that design. It basically inserts a change in electrical characteristics between your radio and the antenna, effectively "tuning" it for you.

Cheers,
Rob

Subject: [FT897] Antenna tuner vs. antenna analyzer

Hi:

In the early stages of setting up my first HF outfit--897D linked to a Super Antenna. I have no trouble hearing stations on 10 and 20 meters. Heard Italy loud and clear on 20 meters. Problem is that no one is hearing me.

One suggestion is to drop the counterpoise that comes with the Super Antenna and drop a quarter-wave radial out my window. The antenna is just inside my apartment window, mounted on a tripod.

I am getting high SWR readings when I transmit and I am getting two somewhat opposing sets of advice. One group says to get a tuner. No surprise there since I always assumed I would probably need one. I intend to get the LDG tuner that mates with the 897

But other people I have talked to tell me what I really want is an antenna analyzer rather than a tuner. Not sure I understand the difference.

Would anyone like to give me their best advice on tuner vs. analyzer
to bring down a high SWR reading.

Thanks

Gordon

24660. DSP or Manual Filters

Yahoo group: FT897 (2009)
Date: 2009-01-17 09:00:19 UTC
From: richie_judson
Topic: 24660 Message: 24660

Dear All
Until now I have survived using only the DSP filtering on the 897D.
Would a dedicated physical filter, for either SSB or CW, make a great difference?
If so, why and which are the best?
Richie J

If you push the DSP button, you can change the menu to the xtal filter menu by turning the mem/vfoch knob. bring put the filter in and try it. you can run both Xtal and DSP filters at the same time. using the above method it is easy to switch back and forth between the two.

From: Steve Yates
Topic: 24660 Message: 24662

Hi Richie,

The main difference is that the DSP filter works outside the AGC loop. This means that signals outside the bandpass of the DSP filter but within the bandpass of the factory filter will still pump the AGC. This can be overcome by backing the RF Gain back to the level of the offending signal and compensating for the loss with the AF Gain. I did this very successfully during contests when I didn't have any additional filters.

I presently have the W4RT 300 Hz mechanical filter and it works great. If you are into contesting, DXing, or anything else where you are tuning amongst many strong signals then an additional mechanical filter will make a useful difference, especially on CW. If not you can probably get by with judicious use of the RF Gain, IPO, and ATT controls.

Keep in mind that I am one who often works DX with very minimalist homebrew receivers, not with FT-Megabux radios so I tend not to be as picky as most hams these days :-)

Gordon, before you purchase additional equipment, IMO you should make sure you understand the basic principles of the antenna. Counterpoise is very important along with other basic things. I çan tune my MP1 any where from 40 to 10 and down to 80 with thee extra coil. And this is without a tuner or other equipment. Take the antenna outside away from things that can interfere and you my see different results, but by all means, learn the antenna first.

Yes, as stated by KM3DR, you should NOT need any other equipment, as the antenna alone, when properly installed, will tune 40 thru 6 meters without extra equipment. Be aware, however, the proper tuning is a little tricky with the MP-1 antenna, because tuning will CHANGE when you move away, usually to a somewhat HIGHER frequency. (EXAMPLE:You may tune to 7.255 mhz., and find that after you take your hands off, and move away, that best performance is at 7.280 mhz.) the solution is to deliberately tune it a little LOW in frequency-Practice will reveal how much.--More coil turns exposed/taller antenna=lower frequency) and use some RADIALS, at least 32 feet long, for best 40 meter operation.-73, KC3VO, Bob Curry

Thanks for the info.

What type/gauge wire should I use for the counterpoise, how do I attach it to the antenna and can it be run inside the apartment or is it best dropped outside the window.

24667. Super Antenna MP 1

Yahoo group: FT897 (2009)
Date: 2009-01-18 05:08:06 UTC
From: LEE
Topic: 24667 Message: 24667

Gordon, I've purchased rolls of small gauge speaker wire from radio shack or the dollar store, cut them into various lengths for the different bands. Used solder less lugs and have soldered as well. Sometimes I've even grounded the antenna in hotels to screw lugs on outlet plates. I've also had success with the supplied counterpoise wires. Looking at Vern's instructions, you should be able to set the SWR without a tuner for the band you want to operate on without a problem. I had a fellow ham that was unable to tune his antenna, when we looked at the mount the washer had shorted the center conductor to ground. Once repaired, the antenna tuned fine. IMO small gauge wire has worked fine for me. The one thing I always stress is to learn the basic principles of the antenna first of all. Today, mine is nothing like the original. I have short black buddipole arms below the coil, longer whips on top, and many other configurations I like to experiment with. I've even used AT / 271 style whips and cap hats on the low bands. I'm sending you a few pic's of my basic 10 to 40 configuration without the 75/80 coil. Correspond with me off list, since this may go back and forth for a while. IMO experimenting with the antenna is a must. An analyzer is a very good tool but understanding the basic principles is a must for any antenna. A tuner is good as well, but it's no good if it's a bad load. You will receive many opinions on this topic for sure.

Have fun and 73's

Lee / KM3DR

Topic: 8239 Message: 24668

Hello Jim (K5QL), Mike (KM6AB), John (AJ5TT), Peter (N3NCD)

Few years ago, I posted several different questions related to FT 897 on Yahoo Groups (August 21, 2004). Here's the link with your answers (Peter's N3NCD is not included in this link, because it was sent sepaarately - I included it in the lower portion of this message) (http://groups.yahoo.com/group/FT897/message/8244

I have to tell you that recently I typed my call sign in Google and was surprised to see those pages were still there. I noticed that on some of the questions I got the answers....and after a while replied, thanking all for help,... but somehow I cannot find my reply to your answers. You answered this question and gave me the info, but I don't remember if I replied privately to you and thanked you, or did not reply at all.

Maybe I did not see your answers, or somehow I replied to you some other way, so it does not show up on public pages. I remember that at that time I had such a setup that messages would come directly to my personal mail, and I was able to reply from my own personal e-mail account.

I would like to appologize if I failed to thank you for your time in answering my question, and providing the information I was looking for.

Whatever happened at that time, I am saying THANK YOU now, just in case, and wish you HAPPY NEW YEAR to you and your families.
Sincerely,
Zoran, VE3ESP

---------- Re: [FT897]
Re: FP-1023
Current SS30M prices at the three of the major dealers:

AES - 139.99
HRO - 159.95
Texas Towers - 139.00

The SS25M is typically $10 less than the SS30M. The SS25 and SS30 (models without meters) are typically $20 less than the ones with meters.

Gentlemen,
I personally think that the ALINCODM-330MV Power Supply is the best
value for the money. It is one of the few which has the following
features:
- small and light weight
- switchable between 125 and 220 V AC (for all international travels)
- instrument for voltage and current
- 25Amps
- fix preset voltage as well as variable output
- switchable oscillator frequency even I have never ever recognized
any
harmonics
- price of $149.50 at HRO

Regards

24671. 897 bands question

Yahoo group: FT897 (2009)
Date: 2009-01-18 23:33:22 UTC
From: Jim Coon
Topic: 24669 Message: 24671

For some reason I seem to have two 80 meter bands on my 897 and they act rather peculiar. For example, I'll call the 160 meters band A, the first 80 meter band, band B, the next 80 meter band, band C and the 60 meter band, band D

when I switch from the 160 meter band (A), to the first 80 band (B), it reads 3.475 MHz, the next band up (C) reads 3.515. followed by the 60 meter band (D) at 5.305 Mhz. This is all on VFOa. When I go back the the 3.475 band, and change it to anything else like 3.600, it seems to swap places with the next band so the next higher band is 60 meters. However, when I switch back I expect to see 3.600 then 3.515. However, instead I see band A = 160 meters, band B = 3.475 (even though I changed that frewquency), then band C 3.600 and Band D 60 meters.

ANy idea what is hapening and how to fix it? why does a band always jump back to 3.457 MHz?

I expected the frequency to be left where I changed it to. However, I change the 3.475 MHz to 3.550 or 3.600 and when I change to a different band and come back it is back to 3.475. What is it about that frequency that it keep coming back to it even if I change it?

From: Carl Wulfestieg
Topic: 24669 Message: 24674

Well, I didn't understand what you were saying- Now I do-
I tried it on my FT-897- No matter what I change, on any band, when I come back, that's where it is - not on some previous setting -
The only other thing I can think of is that the FT-897 seems to have two VFO's, A and B. Unfortunately, reading the manual or not, that's all I know about it- Maybe you're changing one VFO but when you come back the other VFO is holding the "old" frequency? You'll have to ask someone else- I may be wrong- I'm just guessing- But
Try this: Press [F] key momentarily
Rotate MEM/VFO/CH knob until Multi Function Row "a" [A/B, A=B, SPL] appears on display
Now press the [B](A=B) key

Maybe that will help- If not, I give up- LOL LOL

From: Mark Levenite
Topic: 24669 Message: 24675

Jim,

What you are seeing is the "floating" general coverage receiver band. From a full reset you should have the following bands on your 897 (in MHz):

1.8, 3.5, 5, 7, 10, 14, 15, 18, 21, 24.5, 28, 50, 88, 108, 144, & 430.

The 5, 88, & 108 MHz band stops, although not amateur bands are fixed bands just like the amateur bands. The 15MHz band is your "general coverage" band. Whatever frequency you dial into on the VFO if it doesn't meet the specifications for placement into one of the other above-listed bands it will remember that frequency in the "floater" band. This band will then show up between the fixed stops (as listed above)

Examples:

1) Change "3.475" to "4.475" - "4.475" will now be found between 80m and 5MHz bands.

2) Change "3.475" to "8.475" - "8.475" will now be found between 40m and 30m bands.

3) Change "4.475" to "11.475" - "11.475" will now be found between 30m and 20m bands.

In each case the previous setting will be "erased"...while in actuality the band has "floated".

Hope that helps.

Regards, Mark (NM7L)

Hi Josef,
I may presume wrongly, but I think the EU version (FT897D) should be
similar in band to the UK Model !
As I said in my last post to Dave, I opened up my rig for full RX/TX.
The strangest thing, I just found while checking out Top Band on mine ,,,,, to check your info...
Top Bans starts at 1800 Kc and has tx/rx facility on that Tuner knob right up to 7000 Kc. ... and above.
The strange thing is this is now on the 40M band, and when I click back on the band change from this position, instead of having the 70 cms. band displayed it reads 1.8 MHz (1800Kc) ,
If I click back another band change, I am mow truly on the 70 cms. band.
Yes the band does start at 1800, as below that you have receive only and to key the mike (AM) there is no RF out, and the " TX ERROR " displays..
I opened up my rig to have TX on 5 Megs, as I just have this licence before Christmas....
I now find I have an extra " band slot " as I have 160M, 80M, 5 Megs continuous, 40M, 20M, ect....
I asked here a couple of times in caution before the "band opening", and was assured all rigs were the same for the MOD, it certainly works, but it sure is strange.....
I hope this helps

Charlie,

Since I was unsuccessful in answering your question the first time around might I suggest you consult the FT-897D manual, page 66. That page explains how to set up an accessory filter, with figures.

If you do not have a manual one is available for download from Yaesu. URL for the manual download is:

http://www.yaesu.com/downloadFile.cfmfileID=1129&FileCatID=158&FileName=FT%2D897D%5FOperating%20Manual.pdf&FileContentType=application%2Fpdf

Hope this works for you.

Regards, Mark (NM7L)

Actually, there are manuals for both the FT-897 and the FT-897D in the "Files" area of our group site.

As Yaesu owners, we're fortunate to have pretty well written and informative manuals. Owners of some other brand products aren't near so lucky.

24683. Strange memory channels

Yahoo group: FT897 (2009)
Date: 2009-01-20 02:43:25 UTC
From: Selva Kumar R
Topic: 24683 Message: 24683

Hello all,
I find a few channels that are preconfigured on my 897D. These seem to be there from day 1 and I cannot find any references or mention to these in the manual too !!

I tried a complete reset (including memory erase) but didn't seem to help. Now I have a lot of settings and don't want to reset the rig to defaults.

Any idea what these are and how I can get these deleted? The following are the channels I find in the memory group.

M-601 USB 5.332Mhz
M-602 USB 5348Mhz
M-603 USB 5368 Mhz
M-604 USB 5373 Mhz
M-605 USB 5405 Mhz

Best 73,
De Selva,
VU3RWB, India.

Best regards,
-Selva.

DE N7UVL,
Looks like you got a USA version FT-897D with the
60 Meter frequencies. I'm not sure, but I think they
disappear if other expanded range mods are
accomplished on the FT-897./ga

24686. What would be the best HF Linear amplifier for a FT-897D with a Chameleon V1?

Yahoo group: FT897 (2009)
Date: 2009-01-20 04:28:11 UTC
From: chameleon_antenna
Topic: 24686 Message: 24686

Hi,

I own a Yaesu FT-897D for few months now and I just love it. I also have a very good Chameleon V1 HF Multiband Antenna (Max power: 350 Watts).

I would like to know what would be the best (but not too expensive)HF Linear amplifier for it. I would like to output around 250 Watts.

Thanks

Carl

From: Brian J. Scanlon
Topic: 24315 Message: 24687

Hello:

I have just aquired a "new in the box" Ft-897D with a late 2007 manufacture date. This radio exhibits the same behavior as you have described. I have noted that it acts like this for about 30 minutes to an hour before sounding normal. This leads me to believe it is thermal in nature. I have done no further testing yet. The radio is configured to factory settings and is being used with a MFJ 35 amp conventional power supply and an MFJ 1775 rotatable dipole. Both the power supply and antenna also serve my TS-570sg which works flawlessly. I really would like to avoid sending the radio to Yaesu unitil I have the problem nailed down and know for sure taht I can not fix it myself by reseating some of the internal hardware, adding an additional grounding strap, or jiggling some conections. Feedback welcome. How is Yaesu sevice??

Thanks

First off, hello!
This is my first post in the group, but I have been lurking for a while. I got my Technician license in May and I am currently studying for the General. I am going to take it at the end of the month. I don't have an HF antenna up yet, so I have been listening to 2m SSB stuff and I am fascinated.

Anyhow, I bought my FT-897d 12-29-08 and the serial number is 8K030648. Who knows how long it sat at Ham Radio Outlet before I bought it, but there you go.
Thanks for all the information you don't know you have provided me with!

Jamie,

8K030648 means manufactured September 2008 and is the 648th unit in lot 103 (the "1" is missing since it has already cycled once now). Units typically take about 2 or so months to get to the dealer.

The "RM Italy" model# HLA-300 amplifier will provide 300 watts, requires only about 30 watts drive, so you can set the FT-897 for low power, and this amp also has automatic band changing, with internal harmonic filters for each frequency segment. You can sometimes find one on E-Bay. Power for the amp is from a 13.8 volt source, which you must provide, and up to 60 amperes is required.--73, KC3VO, Bob

Jim Coon wrote:
> How do you figure out the numbers? Mine says 6F700127
I saved the below from a posting I found right after I bought my used FT87.
pat----
N1PRS

Simple breakdown of the Yaesu code is below:

Position 1 = year made
Position 2 = month made
C = January
D = February
E = March
F = April
G = May
H = June
I = July
J = August
K = September
L = October
M = November
N = December

Position 1 = last digit of the year in which the radio was produced
Position 2 = month made
Pos 3 &/or 4 = lot number(s)
Pos 5<-8 = sequence in that lot

Example - FT897D 4H370xxx would translate to:

4 = 2004
H = June
37 = Lot number 37

.....YAESU FT8x7: add or subtract 136.660

this is a lil trick to hear image freqs... ya double your 1st IF freq (ft897 is 68.3mhz) ...so double is 136.66... take a 220 freq (224.400 for example) calculate 224.4-136.66=87.74mhz

you should be able to hear (attenuated 60db or so) 224.400 by tuning your 897 to 87.74... however, i think we're stuck on WFM on 87.74... but you get the drift...

if you have a 146.760 rptr close by, try listening 10.100mhz FM :)
if you have a 146.940 rptr close by, try listening 10.280mhz FM :)

if you just key up your ht on 146.520... listen on 9.860 fm :)

try it at field day if ya know the IF of the radio that Homer is running... get him all upset :) hihi

try it for foxhunting... find the 1st IF of your ht & use it for attenuated reception of the fox :)

fun with radios :)

I used to use a RM Italy HLA150 with my FT817. It worked well but got very upset and would bleep loudly and cut out with any mismatch above 1.5:1. I did read somewhere of a simple mod, just replacing a capacitor to make this family of amps a bit less sensetive to moderate swr, but I bought my 897d, so never did it!

I did read somewhere of a simple mod, just replacing a capacitor to make this family of amps a bit less sensetive to moderate swr, but I bought my 897d, so never did it!

OK--"The BEST linear amp" for use with the FT-897, that is readily available to the amateur community worldwide, is the YAESU model VL-1000. This amp. is readily connected for fully automatic bandchanging, can operate at any power level up to 1,000 watts on all frequencies from 1.8 thru 54 mhz. and includes a tuner and A.C. power supply. By adjusting the ALC setting, and/or reducing input RF drive, output may be set to much less than the rated 1,000 watts. Price in the USA, is about $4,000.00 -This amplifier has government approval for amateur use, where required.(I use a modified VL-1000, at 1,500 watts output, with my FT-897)--73, KC3VO, Bob Curry

24707. "All that power"? (reasons/usage of amplifiers)

Yahoo group: FT897 (2009)
Date: 2009-01-24 09:07:43 UTC
From: kc3vo@aol.com
Topic: 24707 Message: 24707

Although my station can be operated at the U.S.A. legal limit of 1,500 watts, I do not always use that level. As stated, power may be adjusted by changing drive level, (or turning the amp off) Having the ability to increase power is very important if band conditions are poor, or the receiving station is experiencing noise or other interference, which must be overcome for effective communication. In keeping with amateur radios use as an "EMERGENCY COMMUNICATIONS" facility for times of disaster, the ability to operate at higher power can compensate for a poor or damaged antenna, and enable reception by stations that may have poor or damaged antennas, or high noise levels, when lower power would not be effective. Think about it-if your life depended on getting a message across, and there were two similar radio facilities, one operating at 10 watts, and the other operating at 1,500 watts, which would you entrust your critical message to? In keeping with emergency preparedness, my entire station can also operate at full power, from batteries charged via solar energy or generator, if A.C. mains power fails or is not available. I have configured similar radios for back-pack portable and motorcycle mobile, all capable of high-power (500 watts or more) operation. YES, I have a >500 watt capable, H.F."Back-Pack" walkie-talkie! I demonstrated it at the last DAYTON HAMVENTION, and NO, the battery is NOT very big or heavy, as it is a very powerful, 8 pound, lithium-polymer unit, that allows at least one hour of communications at 500 watts output. Remember also, that 1,500 watts into a dipole is about the same radiated strength as 75 watts into a 13 db gain beam antenna, and there are times and places where installing the beam antenna is not possible, but erecting a dipole or vertical, or using a mobile whip, is possible-in these cases, availability of higher power is an asset, because although signals can often be RECEIVED on poor/makeshift antennas, transmitting is not as effective.By using high power, communications can be MUCH more reliably accomplished in cases where less than ideal antennas must be utilized, such as portable or emergency situations. 73, KC3VO-Bob Curry

From: Dennis Willson
Topic: 24686 Message: 24708

You are not very specific on your requirements for "the best HF Linear amplifier".
From your posting I assume the following:
Multi-band HF
<= 300 Watts

But... How are you going to use it?
Dx-pedition
Contesting, Field day type
Contesting, from home
Rag chewing
Occasional short conversations but need a little extra punch

Is this strictly for Base operations or mobile, portable?
Is size a constraint?
Any other bells/whistles you want the amp to have? (automatic tuning,etc...)

One thing to consider and something that will effect price is the Xmit duty cycle. If you contest you will need a higher duty cycle which will cost a little more and normally be physically bigger, not to mention a bit more expensive.

If you do field day type contesting it needs to be able to take some extra punishment while if it is just sitting on your desk all the time that is not as near important.

So as people give their opinions, they are referring to how they use their equipment even though that may not be specified. So if a contester says a certain amp doesn't last long, that doesn't mean it won't work just fine for rag chewing...

The more specific you are with your requirements and usage the better the answers you will get.

From: Steve Yates
Topic: 24707 Message: 24710

Wow Bob!

I understand your rational for having the potential for high power perfectly but >500 W from a backpack rig? That's kind of like being a human firecracker! Or is it a dummy load on a stick? Aren't you a bit worried about excessive RF exposure? In that kind of a setup your ARE part of the antenna system.

73,
Steve - AA5TB

24711. Yaesu has very poor quality control at the factory: bias settings sucks !!!

Yahoo group: FT897 (2009)
Date: 2009-01-25 18:33:40 UTC
From: on7wp
Topic: 24711 Message: 24711

WARNING about the lousy quality control at the yaesu factories !!!

Yaesu has very low quality standards and sells time bombs type FT857
FT897 !

Almost incredible ! After reading for the last 5 years about problems
with bias of Yaesu FT-857 FT-897 radios I just came home with my brand
new (2008J series) second FT 857 radio and found out the hard way they
did nothing to improve this at all.

While testing it on the lab bench auditory tests revealed a not so
beautiful modulation.

So I decided to open up the box and check the bias level: A DISASTER !!!!

The predriver was at 95 mA (should be 30 mA)
The driver was at 70 mA (should be 20 mA)
The exciter stage was at 2 x 30 mA (should be 2 x 100 mA)
The HF final stage was at 550 mA (should be 300 mA)
The VHF final stage was at 990 mA (should be 300 mA)

If I wouldn't have opened it I would have blown my VHF final stage at
the first contest, as these currents even increase when heating up. Al
values above were for a cold radio straight out of the box.

I also would like to add the fact that those Japanese engineers don't
know yet that we all are using 3 kHz FM deviation (unit was adjusted
at 5,5 kHz) and a low CTCSS deviation of max 450 Hz deviation (was at
1 kHz adjusted).

The only thing I can conclude from this bad experience is that
virtually nobody at the Yaesu Plant or Yaesu design centre speaks
English or bothers reading reviews or mod sites in order to see what
is severely wrong with their products and do something about it.

So if you also have a FT857 FT897 and you get complaints about rotten
modulation, have somebody check out your radio for these bias
problems. There are plenty of resources on the web explaining how to.
If you are not familiar with SMD stuff please don't try this at home
You can easily toast your radio if you are not a radio whizzz like me

Pedro M.J. Wyns ON7WP ☐ AA9HX

PS today 24/1/2009 another yaesu FT897 was checked from a different
batch and another shop and guess what... finals far too high,
predriver far too low...bad sound...
luckily or unfortunately most hams don't hear the distortion...they

are completely deaf...(or dumb ???)

Not all of the FT897 and FT857s have the same transistors

24713. Re: [FT897] Re: Homebrewing External meter

hooked up a regular ohm meter to the external meter hole today :) using the calibration pot on the ohm meter to set it at FS (full scale) ...so now i have the external discriminator meter i wanted :)

having a great time CTRing the repeaters to see which ones are off freq :) 1 is 3kc & 1 is 4kc low :) even works on AM stations... just listen on fm to wwv & others :)

local pager transmitter is really wide dev... meter jumps around... will test more with different width fm sigs for fun :)

detects super weak stations :) if i vfo-spin slowly across a weak one, it'll show on the meter before it breaks squelch :) might be handy if "Joe" whose radio is always 3kc off tries to check into the net, i'll know it's him by his off freq ID :) lol wonder how accurate it might be with a digital voltmeter.... hmm... "Joe" might be the transmitter that always reads .0000019 or something... almost id'ing him :)

big fun ;)

Its this type of stuff that really sours me on Yaesu products. There is no excuse for that type of nonsense. I was going to buy a Yaesu Ft-897-D but I will be darned if I am going to end up a victim of that sort of stuff. I am going with the Icom 7200 instead. I have had great luck with Icom stuff over the years. My Icom 718 is perfect. My handheld the Icom 32AT is 18 years old and going strong. My girlfriend got me a 2 meter handheld a few years ago and that is great too. Thanks for the info on the bias problems. Joe

Pedro:

I agree that Yaesu has been up to their usual good standards with the bias adjustments on the FT-897. I actually have been putting off doing the bias adjustment on the FT-897 also but the bench is starting to get cleared off, so it may happen soon.

One point of clarification. Not sure what your local norms are, but here 5 KHz deviation is standard and I often see radios from all of the manufacturers that will peak up toward 5.5 when you climb up on the microphone a bit. Also, I believe that 600 Hz is pretty common for the CTCSS deviation here as well when using 5 KHz deviation. For narrow FM you may be closer to correct, but that's not the default for the FT-897's here.

I've enjoyed my ft-897d (although I admit I may too ignorant - unfortunately, that's the truth, not sarcasm - to detect any great defects). It sure doesn't hold a candle to my Pro III but it does do a surprisingly good job, especially for the money. I've had good audio reports, just using the stock hand mike and the receive (other than being a bit too noisy for my tastes) has been good for a double hetrodyne.

I'm delighted that I own one. I bought it with the notion of it being - in my case - a fourth rig. I would not buy it as a main station radio. But for a portable rig that is very inexpensive (so that if the airlines destroy it my life can continue without undo hardship, grin), travels well and has done a credible job from various cabins in the wilderness with a dipole thrown up in the trees, I'm actually thrilled. It has easily surpassed what I hoped for when I bought it. There are better rigs at the same size with basically the same features, it's just that the cost for those rigs was more than was sensible for my bank account for a limited purpose radio. I wanted to spend as little as possible for as much as possible. I think - based on that sort of criteria - that the ft-897d has delivered nicely.

IMPORTANT!---#1. Bias that is HIGH (2 or 3 times normal) does NOT cause distorted audio, LOW bias does! #2. (MOST important) There are at least TWO VERSIONS of finals in these radios, some use FETS, the earlier version uses Bipolar transistors, and bias current is SUPPOSED to be higher with the FET devices in the final! --- Be CERTAIN that the bias setting applies to the circuit as executed in YOUR radio, they are NOT all the same!---73, KC3VO, Bob Curry

Also-LOOK at the part numbers of the output devices in your OLD vs NEW radios, (Finals, on bottom of radio) They are very likely totally DIFFERENT devices, and REQUIRE different bias settings.-73, KC3VO.

Although my station can be operated at the U.S.A. legal limit of 1,500 watts, I do not always use that level. As stated, power may be adjusted by changing drive level, (or turning the amp off) Having the ability to increase power is very important if band conditions are poor, or the receiving station is experiencing noise or other interference, which must be overcome for effective communication. In keeping with amateur radios use as an "EMERGENCY COMMUNICATIONS" facility for times of disaster, the ability to operate at higher power can compensate for a poor or damaged antenna, and enable reception by stations that may have poor or damaged antennas, or high noise levels, when lower power would not be effective. Think about it-if your life depended on getting a message across, and there were two similar radio facilities, one operating at 10 watts, and the other operating at 1,500 watts, which would you entrust your critical message to? In keeping with emergency preparedness, my entire station can also operate at full power, from batteries charged via solar energy

or generator, if A.C. mains power fails or is not available. I have configured similar radios for back-pack portable and motorcycle mobile, all capable of high-power (500 watts or more) operation. YES, I have a >500 watt capable, H.F."Back-Pack" walkie-talkie! I demonstrated it at the last DAYTON HAMVENTION, and NO, the battery is NOT very big or heavy, as it is a very powerful, 8 pound, lithium-polymer unit, that allows at least one hour of communications at 500 watts output. Remember also, that 1,500 watts into a dipole is about the same radiated strength as 75 watts into a 13 db gain beam antenna, and there are times and places where installing the beam antenna is not possible, but erecting a dipole or vertical, or using a mobile whip, is possible-in these cases, availability of higher power is an asset, because although signals can often be RECEIVED on poor/makeshift antennas, transmitting is not as effective.By using high power, communications can be MUCH more reliably accomplished in cases where less than ideal antennas must be utilized, such as portable or emergency situations. 73, KC3VO-Bob Curry

I am going to buy an '897 before spring. Until then, I can only dream about running off too the beach with my vertical and working DX. So, this is in my dream. I want to put a LiPolymer battery (or two)in the compartment in the radio. So this is the question. What are the dimensions of the space provided for the battery? Could one large battery be installed instead of two? Thanks
Bennett, AB2ZJ

Hi David:
You have 2 options.
One is get a diplexor or get a simple antenna swithch (1 in 2 out)
I use a switch backwards to run either a 6 meter ant or switch to my
Gap verticle. The single input is my output to the tuner. $15.
The AT-987 tunes 1.8 thru 54 so it will operate fine.
If you need further info, email me:

Peter:
How about answering the question that David came here to post? How did you add to the discussion or assist David by telling him, in essence, to "RTFM"?? Sorry if I seem a bit testy, but this is one of my pet peeves. Ham Radio is a hobby where "Elmer-ship" is supposed to be encouraged. What happened to the spirit where one Ham helps out another?

David:

My interpretation of the manual is that the AT-897 has continuous coverage through 54 MHz, so you should be able to use it to tune your antenna. No need to bypass - unless you have other good reasons to do so.

Best Regards -

Scott Pettigrew

You complained about this before, I asked then, didn't get an answer,
so I'm asking again: how can you be sure that the "correct" bias
settings you list are, indeed, correct?

I know some values are listed in the service manual, but,
at the same time, yaesu makes design changes between production
batches, such as using different transistors.

The warning about "design changes" in the service man is for a reason.

So, how can you be sure your list is correct?

Geert Jan

Be advised, reccomended idling bias currents for FET devices are MUCH HIGHER tha for equivalent bipolar NPN devices in the FT-897. Mitsubishi, the manufacturer of the RD100HHF1 device, reccommends 1 Ampere per device! The figure for the RD70HVF1 device is 2 Amperes each, and the RD60HUF1 is 2.5 amperes per device. Yes, other values may be used, but gain and distortion will vary. Be careful, determine the devices used, and the correct settings for THOSE devices, as all FT-897 or FT-857 radios are NOT the same!
----------73 and good luck, KC3VO-Bob Curry

> The HF final stage was at 550 mA (should be 300 mA)
> The VHF final stage was at 990 mA (should be 300 mA)

You complained about this before, I asked then, didn't get an answer, so I'm asking again: how can you be sure that the "correct" bias settings you list are, indeed, correct?

I know some values are listed in the service manual, but, at the same time, yaesu makes design changes between production batches, such as using different transistors.

The warning about "design changes" in the service man is for a reason.

So, how can you be sure your list is correct?

Iam not going to answer your question because I don't know.But my opunion is why not play safe and use batteries it was designed for ? Yaesu or W4RT has great batteries. Just my thoughts. I own three FT897's and have the stock or third party batteries and never a problem.
Good luck and you picked a great radio. Spring will be here before you know it.

Hi Scott:
I think David has 2 questions.
Having 2 seperate coax's coming in to the shack, one for a 6 meter antenna and the other for an HF antenna, he has to switch coax's to work one or the other antenna.
The diplexor (or triplexor) would eliminate that problem.
Also, a less wxpensive,but manual way to do it is a 2 antenna switch (Daiwa CS-201) will do the job.
No need to unhook the antenna(s) even if the tuner does its job.
I have one antenna on one input and another, HF antenna on the other input and use the single output (actually marked input) to my AT-897.
An inexpensive way to connect more than 1 antenna to a single input on your rig or tuner.
I agree, no question is dumb when your stuck and you need an answer.
Something simple to many of us is a tough one for one who is not familiar.
'cept maybe the continuous question on the IC-7000 forum on TV operation.

73's Scott

By the way David, hopefully you read this post also, Daiwa has a 4 banger that will work the same way with 4 inputs, but your tuner will only tune 1.8 to 54 mhz so be careful althought you can bypass the tuner with a push of a button.

To place your AT-897 in bypass mode, press the Tune button on the front of the AT-897 tuner and quickly release before the red LED comes on (less than a half-second). The tuner will switch to bypass; RF from your FT-897 transceiver will go directly to the antenna with no matching. There are no LED indicators for the bypass mode

OMG,
I have tested my new FT-897D with extremely careful "hearing" on all bands there was no distortion whatsoever (yes, AM/FM/SSB)!
It's like KC3VO said, it depends mostly on the finals (transistors/fet's) used. And there are no two exactly the same FT-897/FT-857 transceivers alike.
It is so easy to conclude that one transceiver that supposed to have a bad BIAS is a blue-print for every transceiver of the same brand/type. Like the FT-817, there were no two identical transceivers with the same settings (as some found out the hard way).
I would recommend to NOT fiddle with the BIAS until you are 100% sure that there IS distortion in the modulation on a particular band(s) AND you are sure the finals are those according to the service manual default settings.

I've enjoyed my ft-897d (although I admit I may too ignorant - unfortunately, that's the truth, not sarcasm - to detect any great defects). It sure doesn't hold a candle to my Pro III but it does do a surprisingly good job, especially for the money. I've had good audio reports, just using the stock hand mike and the receive (other than being a bit too noisy for my tastes) has been good for a double hetrodyne.

I'm delighted that I own one. I bought it with the notion of it being - in my case - a fourth rig. I would not buy it as a main station radio. But for a portable rig that is very inexpensive (so that if the airlines destroy it my life can continue without undo hardship, grin), travels well and has done a credible job from various cabins in the wilderness with a dipole thrown up in the trees, I'm actually thrilled. It has easily surpassed what I hoped for when I bought it. There are better rigs at the same size with basically the same features, it's just that the cost for those rigs was more than was sensible for my bank account for a limited purpose radio. I wanted to spend as little as possible for as much as possible. I think - based on that sort of criteria - that the ft-897d has delivered nicely.

Using the stock type battery is not a terrible option. I've considered it, but I'd like to see if I can squeeze a few more Watt hours of capacity into the space provided. After all, if i am away from a recharge point I'd like to be able to run for as long as possible. I want a laptop that will run for 48 hours on its batteries, I'm not holding my breath on that one. Besides, technological progress comes from pushing the envelope. That is why we are Hams.

Is there a way to know what the proper bias is for the unit you own? I don't fully fault Yaesu, it is hard to maintain settings in a product made of physical parts. Just read Consumer Reports and see how many defects cars come with from the dealer. Even the "perfect" Japanese cars have 10 or more defects.

I bought my ft-897D 4 years ago an i can say i trashed the nuts out of it.
no problems what so ever , i didn't check any factory settings it was
wide banded(from the dealer) it transmits all freq's capable also 11m
, the rig performs fine , no reports of distorted modulation some
settings are changed as for the carrier freqs , no settings changed in
hidden menu's bla bla.
just leave it original and it will outlive you

Subject: Re: [FT897] dumb question about at 897 tuner

Hi David,
This is my second reply to this post !
Scott has given you the answer he deems as the reply to the question you asked.

I thaught you were refering to an antenna cut for 50 Megs ???

I will once again answer your question, no, David, it was not a stupid question.
If you have a 6M antenna "hooked up" to the FT897 via the LD897 tuner, you have the option to , 1) do nothing with the antenna cables, 2) switch on the tuner and let it find best SWR for the frequency you want to start transmitting
or 3) leave the LD897 switched on , but put it into by pass mode.
If the 50 MHz antenna is a factory made one, and is erected in "clear space" , it should cover the bandwidth of the Amature Frequency allocation.
To go a little further Scott, if David was using say a 40 M di-pole through the LD897 tuner, it would be common practice to erect another di-pole say for17M at right angles to the 40M one,,, and feed them both with the same Co-Ax cable. !! Agreed ??
So lets take amnother situation... David has a nice 65M long wire at 35 feet high down the back garden, and working well through the LD897 on all his favourite bands. Can he now connect the co-ax from the long wire and the co-ax from his nice store bought 50 MHz antenns, TOGETHER..... well if the same pole is used to support the 50MHz ant. and the feed point of the long wire, he can get away with the one run of co-axial feeder. Taking another look at the situation ,,, could he now connect in an antenna for 2M band, as it is a (near perfect) harmonic of 50MHz.. well of course he might, and so on and so on, if he keeps puting up various dipoles, he will come to a situation where he can dis connect the LD897 and not spoil that nice looking FT897, he is so proud of.
David could also buy a second user volume of the ARRL antenna book at a swap meet for a couple of $$$, and also start a bit of homebrew, on an antenna "matcher",,,,,,, hey if I keep typing David will have no time to work DX as he will be building a first effort of an 80M CW , QRP Rig and taking maximum pleasure from doiong so.
That done he will be in good shape to read and understand any radio manual he comes across.
73 and good night,,,,,,,, de Peter EI4HX _._ _._

Subject: [FT897] dumb question about at 897 tuner
~~~

hi all
i am using the at 897 tuner with my 897d rig and was wondering, do i need to put the tuner in bypass mode when i hook to a 6 meter ant or will it let the rig send the signal to the ant if i do nothing at all to the tuner? having read about the so239 on the tuner getting loose from being connected and disconnected alot i dont disconnect my coax jumpers from it i disconnect them from my window plate ant connectors and leave the coax jumpers hooked to the rig.
thanks and 73
david

24745. Using 897 with Icom R-75 rx

Yahoo group: FT897 (2009)
Date: 2009-01-27 05:08:10 UTC
From: tenorman1952
Topic: 24745 Message: 24745

I have a friend with an NIB Icom IC-R75-02 (w/ factory DSP and Sync-AM modules) available for a good price. I'm trying to help him sell it, but also considering picking it up for myself. There are times I would like to monitor one frequency while actively using another.

I had an R-75 in the past. There is an RCA phono jack on the back that if shorted, "Mutes audio outputs and attenuates the receive signal input when grounded. Used for CI-V transceive operation with a transceiver."

Is there a way to trigger this, ground that jack, from the FT-897 when the 897 is transmitting?

I found this in the FT-897 operating manual:

"The rear-panel CAT/LINEAR jack is an 8-pin, miniature DIN type, with the "TX GND" pin providing a closure to ground on transmit, for T/R control of your linear amplifier."

Would it be a simple matter of making up a cable with 8-pin DIN on one end, and connecting to the appropriate pins to a RCA phono plug to mute the Icom R75 when the FT-897 is transmitting?

That should work. You might want to make sure the two radios are grounded at least to each other so you don;t have voltages present, static or otherwise, as you connect the plugs.

I'm sure it could be setup that way; some small amount of
'finagling' may be required..

You're mic needs to be 600 ohm impedance, and it's connector
either would need to be converted to the 'new' modular jack
style or a 'pigtail' converter could be used to convert from
'whatever' style to modular.

Otherwise, I'm sure Heil can provide such a mic with the
correct connector for you (http://www.heilsound.com/amateur/).

Second part - PTT is available at the Data jack. It's a 6-pin
min-din. I usually avoid soldering to tiny pins by buying a
mouse-extension cable (usually has all 6 pins straight thru),
cut off one end (or cut in two, providing TWO potential data
cables!). Your foot switch will just need to short the PTT pin
with ground.

I've used the older Yaesu MD-1C8 Desk mic (with my own
pin-out converter built from an end of CAT-5 cable), and
now I use the Yaesu MD-100A8X and both have great audio.

Date: 2009-01-27 18:45:32 UTC
From: caltwegg
Topic: 24749 Message: 24749

Fellow 897'ers:

Many of us read this list in digest form; that is a whole collection of posts are sent out as a single email. I've noticed many responses which include the full original email to which they are responding and some that even include the full responses and original email. It goes on and on, usually with poor line breaks, until we get to the postee's response: "I agree." or something like that.

Please, when you respond to a post, trim out all the material that isn't immediately relevant to your answer. There's a lot of good information you're offering and it often gets lost in the dreck of the earlier messages.

Thanks,

73

In addition to muting your "separate receiver" during transmit, you ALSO need to disconnect the antenna, to protect the receiver from high-level transmitted R.F., as muting alone will NOT protect against high R.F. levels, only keeps you from being annoyed by feedback/noise.--73, KC3VO, Bob Curry

Topic: 24652 Message: 24756

Hi Gordon,

I'm slow getting back to you, but I was out of internet reach for over a week. In fact, i was hob-knobing with my friend Vern Wright, W6MMA in Quartzsite, AZ at a hamfest.

The MP-1 will give you good results if you set it up with some care and consideration. A good ground system is the key. By all means use the radial system supplied, but I would even add more to it if at all possible--the more the better!!!! I have used the MP-1 system a bunch, and with very good results. I like to add at least one more rod under the coil if possible. I always add more than the basic amount of radials, and it doesn't have to be a big deal--just put more of the same thing on the ground side.

You instinct is correct as to getting an antenna analyzer. Particularly with a system like the MP-1, which can be adjusted to a resonant point. What you really want to know is where to set the antenna coil so that you have a minimum SWR reading. That point would be close to resonance. An antenna analyzer will help you find this point very quickly. An antenna tuner, on the other hand, simply takes what setting you have and tries to make the most of it. That isn't the best way to do it. You may get the tuner to adjust your load so the transceiver is happy, but the antenna may not be set to the most efficient point. That's a significantly different process, and not what you want to do if you can actually adjust the antenna itself to a better setting.

My suggestion of adding rods under the coil helps to find that resonant point by using less of the coil. The less you have to rely on the coil the better. A longer whip section (stinger) helps too. Anything that allows you to use less of the coil, the better the efficiency of the antenna. The better your ground system is, the better your efficiency also.

There are several antenna analyzers out there. The MFJ 259B (or 269) is currently the most popular and inexpensive. It is a tool that every ham should have if they do any antenna work at all! By all means, spend the money to have one. There are better ones out there, but the MFJ will do nicely in nearly all situations.

Play around with the MP-1 system to see if you can't find a better set-up. Try raising the MP-1 off the ground as much as possible too. The higher you get it off the ground, the less you have to rely on radials to balance the system. You will still need radials, but a raised system doesn't need as many. For example, if you can raise it

at least 1/10 wavelength (7 or 8 feet on 20 meters), as few as 4 radials may suffice. However, the 4 radials should be full sized (1/4 wavelength). Remember, you are using a 1/4 wavelength antenna system (the MP-1), and the radials should be approx. 1/4 wavelength as well ideally. When ground mounted though, the rule is that the length is not as important as the number. So a bunch of radials, even much shorter than 1/4 wavelength, is more important than having fewer radials that are 1/4 wavelength long. There is a lot of technical material out there which explains this.

Good luck with your system.

From: maritimus49
Topic: 24757 Message: 24757

Hello All -
I have a problem with accessing the 60 meter channels on my 897D. When I push the V/M button I do get the M-nnn on the dial. However, when I rotate the MEM/VFO CH knob I do not get any change. I have looked in the manual but I can't seem to find out what setting is necessary to get this control to operate. I was under the impression that it is always operating. Any suggestions?

I have the 857, and changing the "channels" is done with the "Select" knob. Have you tried that? Remember that 60m IS NOT TUNEABLE. You are permitted 5 specific frequencies ONLY and are not allowed to stray from those. Yaesu has made sure of that by pre-loading those frequencies into your radio and preventing you from tuning around in that band. It poses a problem for tuning-up in that you must tune on the frequency you intend to use, instead of the normal way we are used to. Anyway, try the select knob and see if that makes a difference. If this is not what you are looking for, then use may want the wideband mod suggested, however, that is an invite for problems from the FCC if you transmit outside of those assigned frequencies.

I don't "play" on 60m because of the restrictions - USB ONLY, 50 watts ERP (remember that it may take less than the 50 watt setting on the radio to attain ERP - depends on how efficient your antenna is), your signal can't "splatter" more than 2.3 kHz (if I remember right) and it is "channelized" to 5 specific frequencies. All this kind of takes the "fun" out of using that band, so to speak - just my opinion.

There isn't a select knob on the 897d. You don't need the mod to get to 60 meters. Read page 23, 45, 60. Make sure you are on vfo A or B and not Mtune before you push the V/M knob.

24761. BHI DSP from W4RT

Yahoo group: FT897 (2009)
Date: 2009-01-31 04:23:20 UTC
From: tenorman1952
Topic: 24761 Message: 24761

Got the BHI DSP installed in my FT-897, works great!

http://www.w4wb.com/BHI/DSP-897.htm

One problem, the control button/led just would not mount on that front right corner of the cover. I fixed that... since I wasn't using the gel cells anyway, and have absolutely no plans to, I removed the A/B battery rocker switch. Just the rocker, not the plastic well. I cut a piece of black textured ABS sheet plastic, glued the button/LED to that with Aleene's 7800 adhesive. That piece is glued into the well where the A/B rocker switch was, and now there is plenty of room and the sunken mounting position protects the switch.

(Aleene's 7800 is a clear, slightly rubbery adhesive that sticks very well to dissimilar materials. E6000 is the same adhesive, but more viscous. Both are found in craft/hobby shops and are necessary items for any workbench.)

To mount the main DSP board, I put a few tabs of double sided tape to hold it generally in position, then put a dab of 7800 on each corner up near the slanted diecast chassis. That anchors that in place. The input/output cable going toward the back of the xcvr is anchored in place with the same adhesive. This stuff is easily cut away and residue removed if necessary.

This DSP performs as advertised, and is far superior to the DSP in the FT-897.

Paul

I went to the URL and tried to download the install manual but got 'Page Not Found'. I sent an email to the company informing them of the broken link.

I would hope that DSP board would work better...the DSP in the radio is IF DSP, I imagine this one is AF ISP???

> Jim KI6PYZ

If the rig has had a complete reset the memories may have been wiped clean. There will be nothing to tune to in the V/M mode.
It has to be re-programmed.
The 897D I have was the same way and I loaded a new RT file and got everything back plus some.
Works great now.
Or
You have to program it the long, manual way.

OMG,
I have tested my new FT-897D with extremely careful "hearing" on all
bands there was no distortion whatsoever (yes, AM/FM/SSB)!
It's like KC3VO said, it depends mostly on the finals
(transistors/ fet's) used. And there are no two exactly the same FT-
897/FT-857 transceivers alike.
It is so easy to conclude that one transceiver that supposed to have
a bad BIAS is a blue-print for every transceiver of the same
brand/type. Like the FT-817, there were no two identical transceivers
with the same settings (as some found out the hard way).
I would recommend to NOT fiddle with the BIAS until you are 100% sure
that there IS distortion in the modulation on a particular band(s)
AND you are sure the finals are those according to the service manual
default settings.

Jerry:
I have been using my 897D with a Heil GM-V mic and the Heil footswitch they offer. When I purchased the mic I bought the Heil adapter to fit the type of radio that I have. It works Great! I love the Heil footswitch.
You can also run other studio mics but you will need to interface with a small mixer before the radio to get proper impedence. I use a Behringer 1202FX to use my Sure SM58 with the radio.
Hope that helps and have lots of fun with the new rig!

Denny

24768. Trying to choose between FT-897D and FT-450AT

Yahoo group: FT897 (2009)
Date: 2009-01-30 21:48:53 UTC
From: Michael Tondee
Topic: 24757 Message: 24768

Hi everyone,
Just as the title subject of the e-mail says, I'm trying to choose between these two radios.
I have no radio at all at present so whatever I get will be my main rig for awhile. These are the only two radios within my reach budget wise at present. I'm just a casual operator, I'm not a serious contester although I do "play" in them quite often just for fun.
My main reason for interest in the 897D is the fact that it covers HF plus 2m and 70cm.
Up until recently I operated on satellites and I might buy the 897D with an eye on eventually getting a second one and having a two radio full duplex sat station. I really have no interest in 2m or 70cm other than that. I cannot afford something such as a TS-2000 or used FT847 or I would go that route.
I feel that the 450 probably has a better receiver and more features for the HF operator than the 897D so I have been toying with the idea of giving up on the sats altogether and going strictly HF with it. I just can't decide. I know a lot of you use the 897D as a portable or a second rig and would not consider it in the role of a "main" station rig so this does give me pause about using it in that manner. Any opinions or suggestions would be most welcome.
Tnx and 73,
Michael, W4HIJ

Yeah, Joe, I had the same problem. I also notified them. But if you will look in our Files under "BHI DSP module on FT-897D" you will find a pdf and two sound file from KB5LDD. Thanks, KB5LDD!

Yes, this is Audio Freq DSP. It has four levels accessed by pressing a single button, which also turns it on and off. It works better than I imagined. It is money well spent. I'm a very happy customer.

I'll post a photo of mounting the button tomorrow.

24772. Re: Trying to choose between FT-897D and FT-450AT

Yahoo group: FT897 (2009)
Date: 2009-01-31 11:57:13 UTC
From: willgord
Topic: 24757 Message: 24772

I faced the same decision about six months ago and was persuaded to go with the 897--in part because I could also use it portable. I live in a high rise New York City building and working HF always was going to be problematical. My fall back is taking the rig to Central Park and operating by battery.

The other issues is a belief offered by some that Yaesu had tried to pack too much into the 450--and the cut corners to get the price down. The turning knob is very small compared with the 897 and you can't elevate the 450 as you can with the 897.

While the 897 can work 2 meters and 440, I still use my own Yaesu 7800 for those bands, if only because the 7800 can be controlled from the mic and a comparable mic on the 897 would be an extra cost option.

Still, I don't think you can go wrong with either. We had an expression in my days as a competition pistol shooter than a given gun could shoot better than the shooter could hold. In other words, the gun was capable of better accuracy than a shooter, giver hand shakes, etc. could actually achieve. Either radio is capable of delivering better results than the average operator can actually achieve.

The display of the 450 makes a big difference. There is nothing like being able to look at all the invormation at the same time instead of going through menus. I found a you tube video that you can look at.

I've posted, in my folder AE5JU in the photos section, a photo of how I mounted the BHI DSP control button.

The A/B battery rocker switch was removed, simply unplugged from the board below it. A pice of textured ABS sheet plastic was glued in place and the switch/LED mounted there with Aleene's 7800 adhesive.

Being they are approx. same in price, you might go to your local ham shop and listen to both and play with each. Your right the 897D does cover a few more bands, but if you don't care about uhf/vhf no big problem. I use the 897D as base with a AT-100 Pro auto/tuner. Have not actually compared the receive on the two so can't say which one is best. Regardless of your choice, I would not get the ATU-450 auto tuner with it. LDG makes auto/tuners for about the same price and they cover more freqs. Good luck. Read some reviews on E-ham that might help you with your choice.

Subject: [FT897] Trying to choose between FT-897D and FT-450AT

Hi everyone,
Just as the title subject of the e-mail says, I'm trying to choose between these two radios.
I have no radio at all at present so whatever I get will be my main rig for awhile. These are the only two radios within my reach budget wise at present. I'm just a casual operator, I'm not a serious contester although I do "play" in them quite often just for fun.
My main reason for interest in the 897D is the fact that it covers HF plus 2m and 70cm.
Up until recently I operated on satellites and I might buy the 897D with an eye on eventually getting a second one and having a two radio full duplex sat station. I really have no interest in 2m or 70cm other than that. I cannot afford something such as a TS-2000 or used FT847 or I would go that route.
I feel that the 450 probably has a better receiver and more features for the HF operator than the 897D so I have been toying with the idea of giving up on the sats altogether and going strictly HF with it. I just can't decide. I know a lot of you use the 897D as a portable or a second rig and would not consider it in the role of a "main" station rig so this does give me pause about using it in that manner. Any opinions or suggestions would be most welcome.
Tnx and 73,
Michael, W4HIJ

Subject: [FT897] Re: Trying to choose between FT-897D and FT-450AT

I faced the same decision about six months ago and was persuaded to go with the 897--in part because I could also use it portable. I live in a high rise New York City building and working HF always was going to be problematical. My fall back is taking the rig to Central Park and operating by battery.

The other issues is a belief offered by some that Yaesu had tried to pack too much into the 450--and the cut corners to get the price down. The turning knob is very small compared with the 897 and you can't elevate the 450 as you can with the 897.

While the 897 can work 2 meters and 440, I still use my own Yaesu 7800 for those bands, if only because the 7800 can be controlled from the mic and a comparable mic on the 897 would be an extra cost option.

Still, I don't think you can go wrong with either. We had an expression in my days as a competition pistol shooter than a given gun could shoot better than the shooter could hold. In other words, the gun was capable of better accuracy than a shooter, giver hand shakes, etc. could actually achieve. Either radio is capable of delivering better results than the average operator can actually achieve.

24777. Re: Yaesu has very poor quality control at the factory: bias settings...

Yahoo group: FT897 (2009)
Date: 2009-01-31 17:39:59 UTC
From: Rob - W1AEX
Topic: 24719 Message: 24777

I have never seen an FT897D transceiver with anything but 2SC5125 devices in the PA stage. Has anyone actually encountered one? The only way to be sure is to pull the bottom cover off and look. The devices are labeled. I realize that Mitsubishi no longer makes them, but unlike the IC-756 Pro III, which also used the 2SC5125, I have not heard of any new PA designs for the 857/897 line. Doesn't mean it didn't happen though. There were rumors that Yaesu might move to the Toshiba 2SC2782 which is a common replacement. I would love to know if the 2SC5125 is no longer used in current production units.

The change in driver devices from the 2SK2975 to the Mitsubishi RD07MVS1 FET devices back about 5 years ago is very well documented, and did change the setup parameters. It also thankfully had a very positive effect on the reliability of the 857/897 rigs.

Regarding the idling current parameters, the bias settings should not vary from unit to unit. Unlike the service menu values, which are unique to each radio due to the range of combined device tolerances, the pre-driver, driver, exciter, and final stages are not unique and need to be running linear to produce a clean signal. The service manual values offered by Yaesu are within the range that puts the devices into linear operation. Sadly, it appears that these settings drift over time, and from what I have seen, they always drift towards cut-off. So, if your rig does not exhibit distortion today, it may tomorrow. As licensed amateurs, we are totally responsible for assuring that our equipment is operating correctly, so if you start getting reports that you sound gritty and distorted, it would be wise to check your driver and PA idling current.

Bob's caveat about not adjusting anything until you know what is inside the radio is very wise advice. If you go to the trouble of doing the bias adjustments, make sure the settings you use apply to your radio.

73,

Rob W1AEX

The 2SC5125 is very rugged and the extremely conservative way they are set up in the 857/897 final stage pretty much assures that failures will not be a common event. Yaesu has indicated to those who have inquired that they have plenty of devices stockpiled in their inventory for repair purposes. If that is not reassuring enough, the Toshiba 2SC2782 device has the same power rating, package design, and higher dissipation ratings. It is widely available (even in matched pairs) and is considered a direct replacement.

24780. 300HZ or 500HZ CW filter?

Yahoo group: FT897 (2009)

From: kybarney
Topic: 24780 Message: 24780

I was looking at W4RT and saw there are two types of CW filters. The 300HZ filter is advertised for contesting and PSK. Would this also be a good filter for everyday ragchewing or should I go with the 500HZ filter?

Is the 2.3KHZ filter a good option for SSB? I think there are only 2 slots in the radio and you can only have 1 CW and 1 SSB filter, each.

Any input is appreciated.

Thanks,
Kyle

Yup, it's been a long time since 6JS6C sweep tubes have been made. But then again, I don't think there's too much demand since (most) televisions today are solid state.

Kyle -

I would go for a good quality 500 Hz filter (INRAD) and utilize the
built-in DSP features of the rig when more filtering is required. There
are certainly enough features in the rig to do more filtering.

It all depends on what you need.

Hello Jim,
      I just recently had a Yeasu FT-101EE that takes the same tube final and I found tubes on one of the tube sites that were made in Russia that worked in the ft-101. However, a modification needed to be done to the final section of the radio to make them work. I did the mod which wasn't to time consuming and the only thing I found was that it had a little less final output, but according to reports the audio was 5,9. Hope, this helps the guy out some as it would be assamed for such an excellant oldie to become a boat anchor.73' from Elkton,Md

If you do not know the answer you probably do not need the filter at
this time.
It is best to operated the radio and get the proper filter if and when
you may need it.
If you do not have any problems you do not need it.
The stock SSB filter is OK as is.
Adding the 500hz filter is OK for normal CW use
A narrow one is not needed unless you are a dedicated contester.

Yes Jim,
      I would guess that it was probably the MRF 477, none of those good rf finals are available anymore and that's a real shame as there are still allot of those oldies out their that requir those finals and are still going strong.
P.S:
     Don't feel bad I forget things all the time & it seems the older I get the harder it becomes to remember, hi hi... its only due to so much technical knowledge in my head there's no room for trivial things. hi,hi...73' from Elkton,Md

Lack of a DSP audio filter is big draw back and hard on your ears after a while. This filter seems like a good addition, however, did you have to give up the battery switch?

24793. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: 2009-02-01 10:42:44 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 24793

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

24794. Re: [FT897] Trying to choose between FT-897D and FT-450AT

Yahoo group: FT897 (2009)
Date: 2009-02-01 17:08:00 UTC
From: Michael Tondee
Topic: 24757 Message: 24794

My thanks to Jim and everyone else who commented. In the end I decided
to go with the FT-450AT. The 897D is a fine radio in it's own right but
I really had no need for the portability feature of it and I decided it
was best to get a dedicated satellite radio down the line a bit and not
try to make the FT-897D do something it really wasn't designed for.
Once I saw the two radios side by side, I decided that while they
seemed to be about on par with each other performance wise that I just
liked the look of the 450 better. I agree the tuning knob is a bit
small on the 450 but it has a nice feel to it and I think I'll get used
to it pretty quickly. Jim you hit the nail on the head about the
display. Since I have no need for the portability aspect of the 897D, I
opted for the bigger easier to read display.
Funny that on a Yaesu list I even got a vote for an Icom radio. I've
had Icom's before and I just don't care for them. Hate the TX audio for
one. I've always gravitated towards Yaesu or Kenwood. Guess it's like
the old Ford/Chevy debate.
Tnx again everyone and 73,
Michael, W4HIJ

24795. Transform FT-897D/I Type B2 in B3 Type, is possible?

Yahoo group: FT897 (2009)
Date: 2009-02-01 18:02:53 UTC
From: Camillo
Topic: 24795 Message: 24795

Hello, it is possible to transform FT-897 "Type B2" in one FT-897
"Type B3"?
Otherwise is possible expand only the band of the 40m (7-7,2Mhz)?
Tnx, Camillo iz6gvc.

Topic: 24757 Message: 24796

One thing that I see that you are not mentioning in these postings about the differences in the two radios. I think that there are pros and cons to both and it depends on what you want to do. The biggest item that is not mentioned below is that the 897D has 2 meters and 70cm which the 450 does not have. To me this is a major difference in the two rigs. If you don't mind not having these extra two bands, then these are factors to consider but I know that for me this makes a big difference in the two rigs. I own the 897D and it was because of these two extra bands that I made this purchase. I do agree that the other rig has a lot going for it but I guess it just all depends on what you are looking for in a radio.
Everybody has difference preferences and it comes down to what you prefer.
I think both rigs have different things to offer.
Bob

Yes, I removed the A/B battery rocker switch. It hung down and interfered with the wiring going to the button in the suggested position on the front right corner of the cover. I tried to put it there.

I unplugged the rocker switch from the board with the cover off, found that the radio worked fine without the switch plugged in. I had to take off the felt piece around the switch, then compressed the tabs on the edges of the switch, pushed it out the top. That left the plastic "well" or bezel that the switch was snapped into.

I don't need the switch as I don't use, nor plan to use this radio with internal gel batteries. I have the Yaesu FP-30b internal power supply in the bottom. And I have a much larger gel cell to use for portable use.

After removing the switch there was room that if I had known this before, I could have placed the DSP board in that area below the rocker switch.

I used a piece of black textured ABS sheet plastic to make the mounting board for the DSP's pushbutton and LED. This plastic sheet is available from www.partsexpress.com in various thicknesses and is commonly used for making panels for car stereo installation. Cost was about $7 USD for a 12"x24" sheet of plastic.

After drilling the holes in the piece of plastic sheet, I glued the switch to it with Aleene's 7800 (a common craft store adhesive). To do this I clamped the switch to the plastic sheet with a plastic rubber jawed clamp used for model building. THEN I applied dabs of the 7800 around the switch and LED. I did this, rather than applying

the adhesive to the face of the switch, so that glue would not get around the button. I let this dry overnight, then glued the sheet to the plastic bezel left in the cover.

This DSP works GREAT!

For those that don't want to install this internally, there is another unit from BHI that connects between the Yaesu's external speaker jack and speaker, and has its own audio amplifier.

From: simon.worsley
Topic: 24800 Message: 24800

Thanks for your help in advance.

Will this amp simply work by RF switching? If so, mine does not so maybe its faulty?

Or what cables do I need - any idea on wiring diagram?

Thanks, Simon

Hello Everyone, I am fairly new to the group. I have a pdf copy of the 76 page Operating Manual. I was wanting to add bookmarks to it, but it is password protected. I was wondering it anyone in the group happens to know the password, OR has a pdf copy of the 76 page manual that is not password protected, they would share please.

24802. Tuner SWR or Radio SWR

Yahoo group: FT897 (2009)
Date: 2009-01-31 18:01:43 UTC
From: pmn1spg
Topic: 24802 Message: 24802

I have a MFJ-945E tuner connected to my 897D. I am using a OCF dipole. I notice that when the SWR on the tuner is at it's lowest the reading on the radio is up a bit. When I get it down on the radio the reading on the tuner goes up. Depending on band this can be over 3:1 on the tuner when 1:1 on the radio.

Which is best to adjust for, the reading on the radio or on the tuner?

Why would the readings be close on some bands and very far off on others?

Thanks

DE N7UVL,
Have you tried monitoring with a Field Strength Meter
to determine which reading actually gives the greater
transmitted signal?
-The perfect match does not equate to the greatest
transmitted signal. (Proof: dummy loads give great
SWR readings)
-Also, other factors could be involved such as grounding.
Do the Tuner; Rig; Transmission line have the same RF
Grounds? Do the readings change when you touch the
Tuner and/or the rig housings? (again a possible RF ground
problem)./ga

Doesn't this sound like a miss match between the radio and the tuner? I'd be inclined to beleive the radio. Nothing to do with which is the most accurate, more to do with the radio knowing what it's SWR is rather than the tuner (because the tuner is further up the line and hasn't a CLUE what the SWR is back at the radio).

qoute; The perfect match does not equate to the greatest
transmitted signal. (Proof: dummy loads give great
SWR readings)

sorry/ can you explain this/ a perfect 1;1 match ie a 50r tx to 50r dummy load means a max transfer match therefore max power transfer. however as the load is screened (should be), there willbe noleakeage or tranfer to the ether
.Thanks

24809. Dumb Question

Yahoo group: FT897 (2009)
Date: 2009-02-02 11:47:48 UTC
From: kd5blz@cox.net
Topic: 24802 Message: 24809

Hi
I have had my FT-897D for about 18 Months. But have not had my much chance to use it. Due to health problems with my wife.
I just ordered the signalink sound card interface to start digital modes for portable us with my lap top.
Last night I was messing around with the menu and could not get the FT-897D into menu 38 as the manual states it needs to be in for digital modes.
I do wonder if this is because here is no For 8-Pin DIN Data cable connected to the FT-897-D.
Anyone have a answer for me?
Thanks
Nathan Watts

From: Gary Altig
Topic: 24802 Message: 24810

DE N7UVL,
The desired result is to get maximum radiated signal
out of the antenna which can be compromised by
many different things. When a discrepancy in SWR
readings occurs, the Field Strength Meter will give
an indication which SWR dip results in the maximum
radiated signal. However, occasionally even that
reading may wind up being the same for each SWR
dip. But at least you will know whether your signal
is being radiated. And further investigation may be
required. Placing the Field Strength Meter where it
can be seen, but away from the Rig (outside a window?)
will help reduce a false FSM reading due to RF in the
"Shack"
-If moving near or away from a "shack" located tuner
and/or the radio causes the SWR reading to change
then there is RF in the "shack"./ga

24811. Re: [FT897] Tuner SWR or Radio SWR

Yahoo group: FT897 (2009)
Date: 2009-02-02 12:20:01 UTC
From: P Grant
Topic: 24802 Message: 24811

Hi Pat, I am reading your SWR situation, and I have come across this phenomena a couple of times some years ago.
Question ? are you using both SWR measuring equipment at the same time ??
Are you using the 897 SWR meter with the MFJ945 in circuit....
or switched to the "through" position.
To do the test, Cancel the SWR mode , on your radio, and tune for best SWR on say 80 M.
Check up and down the band, and record the best "power out" reading at top and botom.
Do the same with all the bands and make a note of the "best SWR / Power out" this should be the same within reason.
The next part of the test involves changing your Antenna tuner to a simple one which has no meter.
You may have to borrow this from a friend. then, repeat all your measurements at the previous frequencies, (allways use AM or CW , and low power, when testing for SWR) using the built in meter in the FT897D.
Bottom line is you cannot use more than one SWR meter at a time, as they will be both,,, in series, and in parralell,,, to each other,,,,and leave opertunity for "unusual" readings across the band.
My advice is, do not use the FT897D, in the SWR mode. the MFJ945 is a reasonable acurate piece of kit, and will be more relioable than using the built in one.
Final test...switch to VHF, if you have a factory built wide band antenna (flat SWR) for say 2M, do the SWR test, first with the 897 meter, (no Tuner) next with the SWR meter off in the 897, and using the MFJ945,
The readings should be the same in both measurements....
That is one of the first questions I asked , when I was trying to go solo, when I was first licenced.
I hope that answers your question, Pat, as you have no doubt noticed, some replies did not give you an answer, but asked another qustion.
I hope this is of some value as it is post No. 7.
Please feel free to contact me of f list for any further discussion.

The tuner is designed to correct the vswr the radio sees. That protects
the radio from high voltages from the high VSWR. Don't worry about the
tuner, worry about the radio. Don't worry about the losses either,
since the energy reflected from the missmatch at the antenna, will be
reflected back toward the tuner, and be reflected back again to the
antenna.

Make sure extended menu is set to "ON" (turn large tuning knob to change it), then go to that menu and turn the tuning knob. Have fun. BTW, make sure that radio is off when you plug in the CAT cable. You don't want static electricity to wreck havoc

No, I have to disagree with this. The desired result is to protect the radio from high voltage on the finals. If you tune for max radiated signal, and blow the finals, you have no signal.

You're both correct. "The desired result is to get maximum radiated signal out of the antenna ..." and at the same time "... to protect the radio from high voltage on the finals." That is why tuning should be performed at a LOW power. As an aside, many current transceivers limit the power, when they sense a high SWR, thus protecting the finals.

From: Geoff Blake
Topic: 24802 Message: 24818

Sorry, I still do not understand. SWR and Return Loss are
different ways of stating the same thing.

Put simply, return loss is the difference between power going "up"
a transmitting aerial and the power coming "down" i.e. being
reflected by the aerial.

It is simple to see that the greater the difference between the
power going "up" and the power coming "down", the more that is
being radiated, either as a signal or as heat in a lossy aerial.

Numerically, VSWR will reduce as Return Loss increases, a 3:1 SWR
being equal to a 6dB loss, meaning 75% of the power is being
radiated whereas a 1.2:1 SWR is approximately equal to a 20dB
return loss, meaning 99% is being radiated somewhere.

The difference between a perfect aerial and a dummy load is the
radiation efficiency, i.e. the proportion of the power being
absorbed by the aerial being radiated as signal rather than as
heat, a perfect aerial having 100% radiation efficiency.

The SWR of an aerial need not have any relationship to its
radiation efficiency hence my query of your statement "Dummy loads
give great SWR readings" - my contention is that dummy loads give
very low SWR readings.

This is all based on your use of the term "great". I presume that
you mean "great" equals large. If you mean "great" equals better
(or smaller SWR readings, then I see where you are coming from and
apologise.

Geoff

Pat, your best swr reading will be on the freq. that the ant is cut for. Just remember a swr reading from a tuner is really falsely telling your radio the swr is 1:1, 1:3 or whatever it is, but in reality you must measure the swr at the feed point of the ant. in order to know what it really is, (hard to take a reading at the ant when it is up in the air). So if you get different readings (tuner vs radio) I would go with the 897D as being more acurrate then the MFJ.

Subject: [FT897] Tuner SWR or Radio SWR

I have a MFJ-945E tuner connected to my 897D. I am using a OCF dipole.
I notice that when the SWR on the tuner is at it's lowest the reading
on the radio is up a bit. When I get it down on the radio the reading
on the tuner goes up. Depending on band this can be over 3:1 on the
tuner when 1:1 on the radio.

Which is best to adjust for, the reading on the radio or on the tuner?

Why would the readings be close on some bands and very far off on others?

Thanks

Hi Again Pat
All things considered, after 16 posts on the subject you now have several views.
from several contributors...
As far as the power reflected back from your antenna, and down the co-ax,
Does the antenna tuner block the reflected power ??? or
is it continued through to the radio. Draw out a sketch of
the circuit of your matcher / tuner, what type of "tune circuit" is it.
Your MFJ945E costs probably $150 US.
and the chip controlling the SWR meter in the rig costs $2 US.
The FT897D is designed to reduce output power if a bad SWR apears
,,, antenna breaks in a gale or such.. This will show up on the display as "SWR HIGH"
or some such,,, has'nt happened me yet, but its good to know it's there.
In the case where an automatic tuner is used the SWR Meter on the screen is just a meter showing the read out.
Bye for now, I hope it goes well for you.

The SWR represents the match between the feed line and the antenna. A 50 ohm feed line feeding an antenna with a 100 ohm feed point will give a 2:1 swr. There is no need to measure the swr at the antenna, because it will be the same at the other end of the feed line.

Remember too, that the swr display on the 897 is APPROXIMATE - NOT ACCURATE! If you want an accurate reading, an external meter is required. I would trust the MFJ over the radio's display. The reading on the radio will get you out of serious trouble, but I always trust the external meter. Also, remember an antenna tuner is more a "coax tuner" since it matches the feedline AND antenna to the radio (well, actually the feedline moreso than the antenna unless you have the meter AT the antenna). Anyway, just wanted to drop my 2 cents worth.

But remember that if there is a miss match between the ATU and the radio (that should be a missmatch between the SWR meter of the ATU and the radio) then the radio is at risk. Inaccurate or not, the meter on the radio is what the radio sees. The meter on the ATU is NOT what the radio sees if there is a miss match between the two. (and yes, that can happen, it happened to me).

Paul.

Ok, A few things in response.... Because WAY too many hams purchase a commercial made antenna, they usually put it together following the Mfr directions, connect the coax, put it on the mast/tower and expect it to work properly. This is a pipedream because ALL commercial made antennas, while they will work for the bands we use, are basically BROADBAND ANTENNAS, meaning they have multiple uses, NOT just amateur - but commercial as well. The failure is the Ham who fails to "tune" the antenna BEFORE he puts it up.

While you are absolutely correct, "tune the antenna for swr", as stated, many forget or just don't do this. Tuning can be done a couple of ways, either with an Antenna Analyzer or with a SWR Bridge/Antenna Tuner - your choice.

However, like I said the failure is to do so BEFORE you put the antenna up, not after! It then becomes an issue of "Why can't people hear me" or "I can't hear anyone on the band and I know they are there".

I fabricate all of my base antennas. The only ones I buy are mobile antennas. If more Hams were to understand that your antenna is 90% of your radio system and take more interest in learning how that thing (antenna) at the top of the mast/tower works, there probably wouldn't be as many tuner/antenna questions in this group.

You can have the best radio, best amplifier, best feedline and best tuner ever made, but if your antenna sucks (or NOT tuned correctly -BEFORE YOU PUT IT UP!), it is all for naught, and as many have found out, it takes all the "fun" out of the hobby (so to speak) because now they are trying to figure out why they can't be heard or hear anyone else, and are even more perplexed as to why the tuner "isn't working right".

Antennas are really easy to understand if you take the time to read/study it. Best book I read is the ARRL Antenna book. LOTS of GREAT info in that book and, IMO, the best book/advice I ever was given from my Elmer (K8BF - SK last October).

That said, good luck!

If you use it for CW operation make sure the key or keyer is not locked in transmit mode. It can happen

First: Return things to normal, by removing any attachments not supplied by YAESU with the radio. (Un hook computer cables, digital accessories, external speakers, sound cards, non-stock microphones, CW keys, etc.) Make certain mike gain menu is set to 50%, Use another radio to LISTEN for modulation. Check mike connectors and cables, at both ends and the radio, for physical damage.--73, KC3VO-Bob Curry

Hello Jim
Difficult to understand what your problem is on first
reading, but I will ask the question...
When you say , no modulation, I presume you mean no audio
transmitted when you transmit. ???
You are right to test the microphone as first suspect, I do'nt like
these Telecom / broadband plugs and sockets on modern radios
and michrophones.
Pull out the mike plug from thefront of the 798 and look in at the row
of wire edge connections... do they look all right to you... have another look with a magnifier
and see if you can see any breakage.
No Joy, well move on to testing the mike itself.You say the
SWR checks out on keying the mike so thats OK. So the PTT is all right...
I have no manual to hand at present, but you can check the
value of the mike insert, and test out the mike pins for the (continuity)...
... corresponding reading. Note the mike pins used, and then
the more difficult part... Checking for continuity INSIDE the radio.
Plug the mike back in the front of the rig, and find the corresponding
connection inside the mike connection.....
Check the value of the insert at the inside of the plug inside the radio.
Hopefully this will show up the problem, as a faulty mike socket...
If that is it you are lucky... if not I'll read up my manual, and
see if I can think of anything else to try.
You said not working on all bands or modes ???
Have you tried CW and Digital modes, have you played around
with mike gain and all the settings on power levels and audio levels.
Do'nt rush off to post back the radio there are some great Yaesu
Radio Men still around, on this forum, with more ideas than me as
I am not familiar with "inside " this small radio. I'm afraid it is all
Magnifier for me when I open the covers, at my age....
I hope this will encourage more replies, as the day is still young.
Best 73 for now... de Peter EIHX _._

Hi
I have had my FT-897D for about 18 Months. But have not had my much chance to use it. Due to health problems with my wife.
I just ordered the signalink sound card interface to start digital modes for portable us with my lap top.
Last night I was messing around with the menu and could not get the FT-897D into menu 38 as the manual states it needs to be in for digital modes.
I do wonder if this is because here is no For 8-Pin DIN Data cable connected to the FT-897-D.
Anyone have a answer for me?
Thanks

From KD5LBE

On the question of Acrobat, I use 8 Professional and I did book marks and sticky notes without any problem and saved the file and brought it back up. I am using the 897 and not the 897D manual as a PDF file. The professional series is really great for turning stuff into PDF files and grouping stuff together in one big file. I wouldn't leave home with out it.

This brings up a question that I have about autotuners, and, I guess, tuners in general. If I have an antenna tuned for multiple bands, but not the one I want to use, and use an autotuner on it, couldn't it have a low SWR at multiple points. For instance, if the tuner was running into a fan dipole that was three dipoles cut for different bands, would there be a separate low SWR for each dipole. One of the dipoles would have a better transmitted signal than the other two, but how could I get the tuner to pick the correct low SWR point? In other words, how could I get a tuner to choose the best dipole for my frequency?

For another example, if a multi-element, multi-band vertical were to be used on a band it for which it was not tuned, could an (auto)tuner match the shortest element instead of a longer one that is a better choice for the transmitted frequency? Is there a way to help an autotuner to chose the better one? I imagine that one could calculate a match for the better elements and start a manual tuner there to look for the lowest SWR; do people do this?

With a manual tuner I guess that the answer is literally in your
own hands

I would have thought that the algorithm used to solve the match in
an ATU's firmware would attempt to find matches closest to Z0
first. Any designers care to comment?

Geoff

My (very) limited understanding is that an ATU changes what the radio
sees, not the antenna. So X amount of signal is going to being coming
out wherever it is, whatever element, and nothing the tuner can do will
change that. So the lowest Z it can find is best for your radio, and
your radiation in to the air stays exactly the same. All that will
change is the heat will be somewhere other than your radios finals,
protecting it. Can anyone confirm or deny?

Ant

Some search for the lowest, but some - I think mainly older ones searched for a value less than say 1.5:1 or whatever the designer chose. There was a debate on this a while back and I remember Dwayne Kincaid of LDG posting a msg that theirs search for the lowest.

You are correct. The tuner tunes for a low swr to the radio. The antenna doesn't care, it will radiate with the antenna with the lowest impedance. The off resonant antennas will represent an higher impedance than the resonant antenna in the fan.

I figured out that it was a stupid question, (stupid because I knew better), not too long after I asked it because the end of the wire from the antenna at the tuner can only have one impedance. For some reason I was picturing in my head one of the SWR curves that varies by frequency. Of course, that may be complex with with several minima, but it is still a single point for any one frequency.

Thanks for the responses. I hope I haven't confused anybody but myself.

24843. Re: Tuner SWR or Radio SWR

Yahoo group: FT897 (2009)
Date: 2009-02-03 17:32:50 UTC
From: ldgelectronics
Topic: 24802 Message: 24843

Peter,

Very nice post. Most autotuners tuner for the lowest SWR, but a few of them actually measure the impedance that it is matching to. Once you think about it, matching to impedance is not always the best way to do it. Although I know which ones do and don't, it's not my place to name names here.

For LDG tuners, we take the approach of matching for maximum power transfer. We feel this is a better way to do it because not all transmitters are 50 ohms. Again, I won't name names or models, but I can say that there are quite a few radios that are not 50 ohms.

So thinking on those lines, suppose a transmitter is 40 ohms. By looking for the maximum power transfer, you match the 40 ohms of the radio to the mismatch of the antenna to give the most amount of forward power while minimizing the reverse power. If the tuner was only matched the antenna at 50 ohms, there would still be a bit of mismatch between the tuner and the radio.

We see this occasionally when someone calls and says they measured the impedance of their antenna with an analyzer and the antenna should be within the tuning range of the tuner. But then they can't get the tuner to match. That's because they forgot about the other half of the equation. They assumed the radio was 50 ohms and it may or may not be.

Unfortunately, there are no easy ways for the average user to determine the impedance of their transmitter. The good part is that most autotuners that look for maximum power transfer take care of that for you now.

On the topic of finding the minimum SWR, again most autotuners do and but some don't. Since all LDG tuners look for the maximum power transfer, it automatically ends up with the lowest possible SWR that it can find.

There was a manufacturer a few years ago started this rumor by claiming that their tuner looked for the lowest SWR and the LDG ones stopped at 1.5. This was just a marketing ploy and it worked for a little while. I think we added some words to our manual back then and we rarely see it come up now.

Hope this helps,

Dwayne Kincaid
LDG

Very interesting information, thank you, Dwayne.

I have a home-brew transmatch -- not to reject your obviously excellent product, but just because I like to build things.

Given what you've said, would I be better served in fine-tuning the antenna tuner to read the power meter (I use an external LDG meter), rather than SWR? Or start with SWR and bring it down, then fine-tune with a power reading?

Thanks,

Lew K6LMP

Lew,

In your case, you are still using the tuner to match the radio to the antenna, so the minimum SWR will come out to have the maximum power transfer.

Remember that an SWR meter is nothing more than a forward power meter and a reverse power meter combined. So the lowest SWR "is" the most power forward and the least power reflected.

You have to be a little careful with an external meter as those are also designed to work only at 50 ohms. A wattmeter like a Bird 43 will give very strange readings with anything other than 50 ohms. That's why you can't put a wattmeter on the "antenna" side of the tuner (unless the tuner is in bypass) and get a meaningful reading.

So it's possible to run into the same problem with the transmitter not being at 50 ohms giving a slightly off reading on an external meter.

The bottom line is you have to make the radio happy (we're talking modern solid state radios). Whatever setting it takes to get the radio to put out the most amount of power with the least reflected is the right setting.

Dwayne Kincaid

Pat,
By your description, what you have is an undesirable situation, which
is at certain frequencies, your antenna begins at the FT-897d coax
connector. Your selected tuner, the FJ-945e, is not set up to tune a
dipole antenna, but can do such under certain specific situations which
are described in the tuner manual. Please refer to this manual, and you
will notice the following:
"WARNING: To avoid problems, a dipole antenna should be a full half-wave
on the lowest band.
On 160 meters, an 80 or 40 meter antenna fed the normal way will be
extremely reactive with only
a few ohms of feedpoint resistance. Trying to load an 80 meter (or
higher frequency) antenna on
160 meters can be a disaster for both your signal and the tuner. The
best way to operate 160 with
an 80 or 40 meter antenna is to load either or both feedline wires (in
parallel) as a longwire. The
antenna will act like a "T" antenna worked against the station ground."

To answer your question, the best SWR is the one displayed and measured
at the Radio Output connector.

73

Sun Feb 1, 2009 9:55 pm (PST)

I have a MFJ-945E tuner connected to my 897D. I am using a OCF dipole.
I notice that when the SWR on the tuner is at it's lowest the reading
on the radio is up a bit. When I get it down on the radio the reading
on the tuner goes up. Depending on band this can be over 3:1 on the
tuner when 1:1 on the radio.

Which is best to adjust for, the reading on the radio or on the tuner?

Why would the readings be close on some bands and very far off on others?

Thanks
Pat L

The maximum power theorem says that maximum power is trans when the load matches the source impedance. When that situation exists, 50% of the power is dissipated in the load and 50% in the source. While in small signal circuits, you want maximum power transfer, and you want the feedline to match the antenna, you normally want the source impedance to be much lower than the load in a power circuit. That way power reflected from the antenna mismatch, will be reflected back towards the antenna. If the transmitter impedance matches the reflected power will be converted to heat in the transmitter. As an extreme example, imagine what would happen if the power company matched it's generator for maximum load and the load is 20 megawatts. If maximum power is transferred, the generator would also dissipate 20 megawatts and it would need a lot of cooling and power would be wasted. Instead they make the generator a low impedance, so even though you don' t have maximum power transfer, you don't burn up the generator. The same principle applies to the RF final stage of a transmitter. You don't want to put 100 watts into the antenna and also dissipate 100 watts in the final stage, so the solution is to build the final stage so it has a lower impedance than the feedline to get maximum efficiency with power going tothe antenna and not in the finals. At the antenna you want to keep the reflected power to a minimum. The tuner should keep the swr the radio sees from the antenna mismatch and feedline match from damaging the output stages due to high voltage.

24848. Re: Tuner SWR or Radio SWR

Yahoo group: FT897 (2009)
Date: 2009-02-04 01:51:38 UTC
From: Patrick Lynch
Topic: 24802 Message: 24848

Thanks to everyone who responded and put thoughtful time into this issue. I have gotten so many different answers, guesses and completely unrelated comments I figure no one knows. I do appreciate the level of consideration given here as compare to another group I submitted the question to.

Tonight I tried an experiment and added another meter to the mix.

First the chain went like this:

Radio - Diamond SWR Meter - MFJ Tuner - Antenna

The point here was to see if the diamond SWR meter agreed with the SWR meter on the radio.
It did.

Then The chain went like this:
Radio - MFJ Tuner - Diamond SWR Meter - Antenna

The point of this was to see if the diamond SWR meter agreed with the MFJ meter.
It did
Now, please know that I did re-calibrate the Diamond SWR meter each time I adjusted the controls on the MFJ tuner.

What I learned is that the differing SWR readings I am seeing on the MFJ and the radio are really different.
Something I suspected was proven. As I adjust the tuner for the lowest reading on the radio (higher on the tuner) The forward power reading on the Ddiamond increased between the tuner and the antenna.

So it appears to me that the meter to watch for when adjusting is the SWR meter on the radio. I know there are allot of buts and I am saying SWR which can bring up many other points and arguments. When it came down to measuring there was more forward power after the tuner to the antenna as the reflected power reading on the tuner went up and the SWR reading on the radios meter went down.

Why? I have not figured this out yet but I do not believe it is a flaw in my station layout or equipment.

I am using an off center feed dipole. Forgive me it is a radiowavz. It will soon be replaced. You live, you learn.
The antenna is supposed to work on 40,20,10 meters without a tuner.
Well, I need a tuner. With my MFJ I can tune 60M-10M and get away with 6 Meters
The bands where the antenna is designed to work are the bands where

the MFJ meter and radio meters agree or are very close to agreeing.
I suspect that the bands where I see a big difference are the band
that are a struggle for the tuner. i.e 12 meters.

So thats where I am at now.
Any thoughts are welcome and appreciated.

Thanks
Pat Lynch

You get differing reading because of a missmatch between the radio and the SWR meter. Like I said in my last post, this happened to me. As I said, and as you have found, you are correct to go with the reading on the radio. try changing the patch lead for one of a different length or use a male-male adaptor and see what happens then (this is something I didn't try, I simply used the meter on the radio and ignored the one on the tuner).

I am suprised no-one else has said they have had this problem before.

Let the auto tuner provide the match to the feeder, and the RF will
resonate on the correct length dipole it sees fit.

Thanks Peter,
You are correct. No audio transmitted in any mode. I connected a key and in cw mode I get a tone but no transmit power. I tried keying the mike and then the key and I can transmit code in to a dummy load and see the power out on the external power meter. I had not tried this operation before. I still can not modulate the carrier in AM, FM or SSB. I do get a carrier in AM and FM mode when I key the mike. This could indicate a transmit relay problem in that the mike output is not being switched with the mike button depressed. Does any one else have a suggestion?
Thanks, Jim N0TUI

Hello Jim
Difficult to understand what your problem is on first
reading, but I will ask the question...
When you say , no modulation, I presume you mean no audio
transmitted when you transmit. ???
You are right to test the microphone as first suspect, I do'nt like
these Telecom / broadband plugs and sockets on modern radios
and michrophones.
Pull out the mike plug from thefront of the 798 and look in at the row
of wire edge connections... do they look all right to you... have another look with a magnifier
and see if you can see any breakage.
No Joy, well move on to testing the mike itself.You say the
SWR checks out on keying the mike so thats OK. So the PTT is all right...
I have no manual to hand at present, but you can check the
value of the mike insert, and test out the mike pins for the (continuity)...
... corresponding reading. Note the mike pins used, and then
the more difficult part... Checking for continuity INSIDE the radio.
Plug the mike back in the front of the rig, and find the corresponding
connection inside the mike connection.....
Check the value of the insert at the inside of the plug inside the radio.
Hopefully this will show up the problem, as a faulty mike socket...
If that is it you are lucky... if not I'll read up my manual, and
see if I can think of anything else to try.
You said not working on all bands or modes ???
Have you tried CW and Digital modes, have you played around
with mike gain and all the settings on power levels and audio levels.
Do'nt rush off to post back the radio there are some great Yaesu
Radio Men still around, on this forum, with more ideas than me as

I am not familiar with "inside " this small radio. I'm afraid it is all Magnifier for me when I open the covers, at my age....
I hope this will encourage more replies, as the day is still young.
Best 73 for now... de Peter EIHX _._

The manual says there is a user setting for the modulation. Check that first and then I would check the mike and make sure it is operating.

The technical manual I have says: The audio signal from the microphone jack on the MIC unit is amplified by audio amplifier q1109, (2sc4154e) pm the main unit, and then is applioed to electronic volume control IC Q1087 (m62364EP). The level of which is set via the User Menu.

The Mic Unit consists of the RJ45 socket, and JP4701 where it connects to the main board. The pins on the mic jack are as follows:
1. mic -DNv
2.mic - UP
3. 5v
4 mic gnd
5. MIC
6. PTT
7. GND
8. POSW

If there has been any tampering with the ribbon cable to the front panel, that can cause the problem, if damaged or improperly seated. CW operation, as described, seems NORMAL. CW keying is influenced by setting the menu items regarding VOX, BK IN, Semi BK IN, and keyer. (see manual, CW operation)-

If you use that tripod, the most versatile one would be the one with the NMO because you can get an NMO to to 239 adapter, but I don't think you can get a 239 to nmo adapter. So if you get it with the NMO fitting, you can use it with other antennas years down the road.

Hi James
The worst has not happened, BUT,
You said previously that you could key the PTT and get a power out reading on
a (swr) meter ...
You now sey you tried to key up in CW mode,,,, NO Transmit power, only a tone, I expect
from the loud speaker...
This has me stumped compleetly....
Have you tried to read the mike insert resistance on an ohm meter ???
And checked the mike cable and plug on the inside of the FT897D.
There is a conflict here, I do'nt understand, it has to be the mike circuit, but no RF on
CW output, I do'nt know...
keep looking.
73 for now

24858. Re: [FT897] Re: Tuner SWR or Radio SWR

Yahoo group: FT897 (2009)
Date: 2009-02-04 18:04:10 UTC
From: Jim
Topic: 24802 Message: 24858

I found a link in wikipedia that will help explain the maximum power transfer theorem. It helps to understand why the impedance of the radio should be much less than 50 ohms

http://en.wikipedia.org/wiki/Maximum_power_theorem

I will quote part of it.

In electrical engineering </wiki/Electrical_engineering>, the *maximum power (transfer) theorem* states that, to obtain /maximum/ external power from a source with a finite internal resistance </wiki/Electrical_resistance>, the resistance of the load must be made the same as that of the source. It is claimed that Moritz von Jacobi </wiki/Moritz_von_Jacobi> was first to discover the maximum power (transfer) theorem which is referred to as "Jacobi's law </wiki/Moritz_von_Jacobi#Jacobi.27s_Law>".

The theorem </wiki/Theorem> applies to maximum /power/, and not maximum /efficiency/. If the resistance of the load is made larger than the resistance of the source, then efficiency is higher, since most of the power is generated in the load, but the overall power is lower since the total circuit resistance goes up.

If the internal impedance is made larger than the load then most of the power ends up being dissipated in the source, and although the total power dissipated is higher, due to a lower circuit resistance, it turns out that the amount dissipated in the load is reduced.

and the part that is easily confused by hams

Maximizing power transfer versus power efficiency

The theorem was originally misunderstood (notably by Joule </wiki/James_Prescott_Joule>) to imply that a system consisting of an electric motor driven by a battery could not be more than 50% efficient since, when the impedances were matched, the power lost as heat in the battery would always be equal to the power delivered to the motor. In 1880 this assumption was shown to be false by either Edison </wiki/Thomas_Edison> or his colleague Francis Robbins Upton </wiki/Francis_Robbins_Upton>, who realized that maximum efficiency was not the same as maximum power transfer. To achieve maximum efficiency, the resistance of the source (whether a battery or a dynamo </wiki/Dynamo>) could be made close to zero. Using this new understanding, they obtained an efficiency of about 90%, and proved that the electric motor was a practical alternative to the heat engine </wiki/Heat_engine>.

Bottom line is you want the antenna and feedline to match, but not the radio. You want the radio to see a low amount of reflected power from the antenna and feed line.

Ant:

Not really.

Think of it this way. Many antennas have reactive elements used to make them resonant at one or more operating frequency (loading coils, capacity hats, etc). I don't think anyone would argue that having or not having those elements directly affects the behavior of the antenna and the amount of energy that's radiated. So, how much difference is there between having those reactive components in the middle of the antenna, at the base or feed point of the antenna, inside a box at the base or feed point of the antenna, or some distance down a transmission line? Clearly there's some, but in all cases the use of those elements do directly affect the current and voltage at the antenna and therefore the amount of energy radiated.

As to the multiple elements of a fan dipole or other multi-band antenna, consider that the antenna presents a particular complex impedance that is the result of all elements of the antenna, whether they are resonant or not. It is that impedance against which the tuner serves to provide a match.

So, yes, there's a clear difference in the amount of energy radiated in addition to how much energy ends up consumed as heat in the transmitter.

If it is one counterpoise, it must be the correct length for the band you want to operate. You could try multiple radials "counterpoise" cut for each band. You could try just laying them on the floor and out the

window. The more the better in any direction you can. Don't know if flat 4 or 6 wire cable is sold, but could cut each wire for a certain band. A little bit nicer looking.
An antenna analyzer is nice to have, which I do, but it won't be much help with a short vertical.
My apartment antenna is a square 5 foot loop inside a double window and a SGC tuner. Tunes great. About 80 feet of zip cord is used in the loop.

My only problem is that after having a great DX station and now in an apartment, I have lost interest and if I live long enough for the next cycle I may get some interest back. After all, working 10mtr dx with a wet noodle can be really fun.

Subject: Re: [FT897] What would be the best HF Linear amplifier for a FT-897D with a Chameleon V1?

You are not very specific on your requirements for "the best HF Linear amplifier".
From your posting I assume the following:
Multi-band HF
<= 300 Watts

But... How are you going to use it?
Dx-pedition
Contesting, Field day type
Contesting, from home
Rag chewing
Occasional short conversations but need a little extra punch

Is this strictly for Base operations or mobile, portable?
Is size a constraint?
Any other bells/whistles you want the amp to have? (automatic tuning,etc...)

One thing to consider and something that will effect price is the Xmit duty cycle. If you contest you will need a higher duty cycle which will cost a little more and normally be physically bigger, not to mention a bit more expensive.

If you do field day type contesting it needs to be able to take some extra punishment while if it is just sitting on your desk all the time that is not as near important.

So as people give their opinions, they are referring to how they use their equipment even though that may not be specified. So if a contester says a certain amp doesn't last long, that doesn't mean it won't work just fine for rag chewing...

The more specific you are with your requirements and usage the better
the answers you will get.

Subject: [FT897] 300HZ or 500HZ CW filter?

I was looking at W4RT and saw there are two types of CW filters. The
300HZ filter is advertised for contesting and PSK. Would this also be
a good filter for everyday ragchewing or should I go with the 500HZ
filter?

Is the 2.3KHZ filter a good option for SSB? I think there are only 2
slots in the radio and you can only have 1 CW and 1 SSB filter, each.

Any input is appreciated.

Thanks,
Kyle

24866. filtering for VHF FM?

Yahoo group: FT897 (2009)
Date: 2009-02-05 05:45:53 UTC
From: Ant
Topic: 24866 Message: 24866

I have a problem with my location and my 897d. My location has several high power VHF pager channels just above the ham band, and I get a lot of bleed through(?) when monitoring within the VHF ham band. Some mates of mine use a frequency on VHF, and do not use CTCSS. I am unable to sit on the side of the frequency due to only having so much patience for this interference. The other guys are using motorola commercial radios, and have no problems with RX at all. It is not my location, as I took my radio one of the other stations home and used his antenna, and the problem only occurred with my 897d. Incidentally my VX-1R handheld has the same problem.

Is there any filters available for the 897, or something already in it that I can use that solve this problem? The digital interference rates up to about S7 on the meter.

Thanks,
Ant

Topic: 24873 Message: 24873

Hi Folks,

Does anyone have an idiots guide to programming the memorys on a 897d.
I've had a look at the manual but lost intrest very quickly. Tried the
old method of keep hitting buttons but aint got any where.
What i need is something like:

1: Enter memory
2: Hit knob so and so
3. memory stored.
4. Call it a name - say repeater 1

Thats all really,

Can't be to difficult can it.....????????

Or is it?

Topic: 24873 Message: 24874

Re-read the damned manual!

No seriously, get a 'pocket' book called the Nifty Mini Manual.

Go to www.niftyaccessories.com and look for the 857D/897D manual. If memory serves, it is around $18.00 bucks. I think I also saw one on eBay in the Yaesu FT-897D section. Ok, I did..here is the URL:
http://cgi.ebay.com/Yaesu-FT-897-FT-897D-Quick-Reference-Guide-FT897_W0QQitemZ310084388597QQihZ021QQcategoryZ15050QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

Or, go to eBay.com and search for item number 310084388597

Programming the 897D can be a chore. It took me forever to learn enough to get by. As my 897D is strictly a shack back-up and field/camping radio, it doesn't get used much so I have to refer to the mini-manual for some menu settings.

Have fun!

It is not views that you want, it is facts, and these facts will
depend on what you want to do..

By all means, if you want to match the output of the 897 to the
input of the amp, then put the ATU between the 897 and the amp.

OTOH, if like most people you wish to improve the match of the
aerial to the output of the amp, then the ATU belongs between the
amp and the aerial.

There are certain advantages to place the ATU at the aerial end of
the feeder, but generally putting it at the TX end (in this case
the amp end) will suffice.

Dave-
The following may help you. I don't bother to "name" my memory locations. I usually keep the memory locations in numerical order by frequency, and then remember or write down the various frequencies and what it is. Having said that . . . .
Here we go:

1. Tune in frequency

2. Set up CTCSS Tone
a. Press "F" momentarily
b. Select multi-function row "e"
c. Press (A)(TON) to activate tone encoder [TEN]
d. To change CTCSS frequency press (A)(TON) 1 second
e. Rotate dial to select proper frequency
f. Press and hold "F" to save new setting

3. Press "F" momentarily

4. Select multi-function row "b"

5. Press (A)(MW) momentarily

6. Rotate MEM/VFO/CH knob to select channel for storage

7. Press and hold (A)(MW) for 1 second (2nd beep)

You've probably guessed that you have to store the info in a memory channel to make it work.
Follow the above steps exactly and you should be in business. Good Luck.

Did you ever consider the FT-857D? Some people get it because it has a removable control head that can be mounted (with cable) where you can see it while driving. Otherwise, mount the FT-897D in some way and position so you can see it while driving. Alternatively, stop driving while you are adjusting the transceiver?

Or to put it another way,
The radio has an unbalanced 50 ohm in / out put,
The Amplifier has an unbalanced 50 ohm input / output,
The ATU has an unbalanced 50 ohm input,
and you try to arange an unbalanced 50 ohm output with the
ATU by adjusting the L:C ratio to get the best Match,
to keep the finals of the amplifier happy.

ATU--ANTENNA tuning unit-It will NOT tune the antenna UNLESS it is connected
to THE ANTENNA! If you connect it between the radio and the amp, it would
tune to the input of the amplifier, not the antenna,and any worthwhile,
properly designed, HAM amplifier will not require an antenna tuner to present a
reasonable match to your radio.--73, KC3VO, Bob Curry

The ATAS120 is self tuning. You dont need a tuner and it won't work
with a tuner because it gets it's DC power from the radio

IF you put it between the radio and the amp, you will have to have a
second one to match that amp to the antenna or risk damaging the amp.
Since the input of the amp is designed to match , there is little use
for it at that point. It will not buy you anything there. at the
output of the amp it will.

24886. RE: [FT897] filtering for VHF FM?

Yahoo group: FT897 (2009)
Date: 2009-02-05 12:31:09 UTC
From: Eric van de Weyer
Topic: 24866 Message: 24886

Hi Ant,

We used to be really badly plagued with it here in Sydney, especially in the eastern suburbs and there is a fairly simple way to reduce the problem drastically BUT there is a caveat. On receive, you can put a T piece in the antenna line close to the radio and then put a 1/4 wave open stub cut for the pager frequency. To make it, calculate the length needed (don't forget the velocity factor of the coax) and then connect a piece of coax to a connector to mate with the T piece. Now, carefully trim back the coax until you get maximum attenuation of the pager signal. You will still be able to here the wanted signals as long as they are not right at the band edge.

Now the caveat, the open circuit stub looks like a short circuit at its resonant frequency and a bit either side of it so you MUST remove it from the line when you transmit otherwise your transmitter will be looking into an almost short. There are a few ways you can do this and two that I have used in the past are as follows. One involved making up a special T piece in a small copper box with a relay in circuit which left the antenna connected to the radio all the time but disconnected the stub , by opening the relay contacts, when the PTT is pressed. The other way is to use the relay contacts to short the open end of the stub during transmit. This changes it to a shorted stub which makes it look like an open circuit to the transmitter.

As I said, I have used both methods successfully in my mobile installation many years ago and for a number of years. We now have CTCSS on the output of our repeater so I no longer need the stub.

It is also possible to buy filters specifically made to do this job. Jenlex filters in Melbourne used to make them but they were fairly pricey but effective. I think they will design and manufacture to order. A quick Google search just showed that they still exist.

Subject: [FT897] filtering for VHF FM?

I have a problem with my location and my 897d. My location has several high power VHF pager channels just above the ham band, and I get a lot of bleed through(?) when monitoring within the VHF ham band. Some mates of mine use a frequency on VHF, and do not use CTCSS. I am unable to sit on the side of the frequency due to only having so much patience for this interference. The other guys are using motorola commercial radios,

and have no problems with RX at all. It is not my location, as I took my radio one of the other stations home and used his antenna, and the problem only occurred with my 897d. Incidentally my VX-1R handheld has the same problem.

Is there any filters available for the 897, or something already in it that I can use that solve this problem? The digital interference rates up to about S7 on the meter.

Thanks,
Ant

Hi Simon,

You are exactly correct. The job of the ATU is to help match the antenna system (includes the antenna and transmission line) to the transmitter so it MUST be the last thing before the antenna system.

73....Eric VK2VE.

Get a frequency counter and put a small antenna on it and it will read out the frequency when you transmit. However, you will have to tune, then transmit, then tune again if it isn't right, Another way is to use the memories. There is a mike you can get that you can enter the freq from the mike or enter the desired memory channel.

Hi Dave,

Have you thought about using one of the programming/control programs such as FTBasicMMO? You can set it all up with the computer on screen. All you need is the CAT interface cable between the computer and the radio. They can be found on Ebay quite cheaply, I believe or you can make your own, which is what I did.

Hi Folks,

Does anyone have an idiots guide to programming the memorys on a 897d.
I've had a look at the manual but lost intrest very quickly. Tried the old method of keep hitting buttons but aint got any where.
What i need is something like:

1: Enter memory
2: Hit knob so and so
3. memory stored.
4. Call it a name - say repeater 1

Thats all really,

Can't be to difficult can it.....????????

Or is it?

I think this can be simplified

1. set radio to frequency and setting you want to use.
2. press "F" momentarily to activate the function rows and change to
multifuntion row "b"
3. Press programible button A, momentarily (the one with the MW above
it. MW is Memory Write)
4. Rotate MEM/VFO knob to select channel for storage
5. Press anmd hold button A, (MW) for 1 second until you hear the beep

Another possibility is to get John Hansen's Millenium QSYer, which hooks up to the CAT interface, and use it to keyboard enter the frequency directly. I have several of them and they are invaluable. It will even set the correct mode for the part of the band you go to, in the US anyhow.

Here is a good link explaining impedance, also, from my friend Bill Lieske's site. And I would say he knows a little about antennas.

http://www.emrcorp.com/techinfo.html Read, or download/save "The Fifty ohm Enigma".

Bill's company not only makes commercial antenna gear, duplexers, etc, but Bill is one heck of a good saxphonist, too, which is how I know him.

You do not need a tuner, as it is a screwdriver type antenna. The tuner is built into the radio/antenna combination. Once you tell the radio by setting up the correct configuration menues that an atlas antenna is connected all you need to do is dial to the frequency you desire to use and press the tune button on the radio. The radio/antenna does the rest. Look in the manual for the 897 and it does explain the use of it there. Remember it is only good for 70cm-40m and wont auto tune on 80 or 160.

I've had one for about 9 months and it works great!

THe object is to get the frequency to work first then save it.
Alternately you can put the frequencies in and when you use them, make
the corrections needed and re save them. So if you break it down into
the modules, /1. set up the frequency to save and 2. the actual saving,
while number 1 will change depending on what band you are on, number 2
will always be the same procedure.

Thats my story and I'm stickin to it.

The ATAS 120 is a different animal than the AT120.

From: kc3vo@aol.com
Topic: 24873 Message: 24905

I wonder how many readers are aware that FET D.C. bias settings have been known to DRIFT, often to a lower value, during the first 6 months to one year of operation? Some manufacturers deliberately set the initial levels high, so that, after time, they wil be near normal. One manufacturer sets the bias at 2.0 amperes for NEW devices, knowing that a year later, it will settle close to the desired value of 1.6 amperes. (If it really bothers you, adjust it every 6 months!)--After 2 years of use, drift is normally much less.---Buy a three year old, used radio, and check/adjust it?--73, KC3VO, Bob Curry

It is a pretty good write up but he assumes that the exciter has to match the PA. The two stages really only have to match each other in "small signal" situations, like the receiver stages. In power stages you don't need the exciter to match and it is better if it is a lower impedance that the PA, just as it is better the the PA output impedance to be lower than the 50 ohms of the feed line.
He is mixing up or confusing "Maximum power transfer" with "efficiency" The greatest efficiency will be when the power source has a lower impedance that what it is feeding. Take for example a 1 KW power amp. If the amp has the same impedance as the feed line and antenna, to put 1,000 Watts into the antenna, the amp will also have to dissipate 1,000 Watts, because at maximum power transfer 50% is in the load and 50% isin the source. However if it is a lower impedance, then a greater percentage of the power can be dissipated in the antenna than in the source and the PA doesn't have to use as much power and can run cooler.

Again, consider a power station generating many megawatts of power. It has a load of Rload, and in internal resistance in the generator of Rgen. Maximum power transfer will occur when Rload = Rgen . However, a 100 megawatt machine would require a lot of cooling, so instead the Rgen is much smaller to reduce generator losses. The same thing applies to RF

Hi Jim,

firstly, you are not comparing apples with apples. The situation with the power station is NOT the same as with the transmitter and the antenna so it is not valid to use one as an example for the other.

In the case of the power station, you have a source which is connected to millions of loads, all in parallel. each one only wants to use the amount of power it needs to do what it has to do so, for instance, you might have a generator capable of, say, 1000W which can power a 1000W lamp or it might be called on to supply 10 x 100W lamps, or 100 10W lamps. The 1000W lamp might ent up with virtually the same resistance as the generator's internal resistance but the 100W ones would have 10 times the resistance, and the 10w ones would have 100 times the resistance each but when all put in parallel the equivalent resistance is the same as the 1000W one.

On the other hand, with the transmitter and antenna system, which consists of everything between the output of the transmitter and the antenna itself (antenna, feed lines, tuner, interconnecting cables etc.) we are not using a source which we want to connect to a lot of loads, we are trying to get the maximum power transferred between the transmitter and the antenna and the only way to do that is to have the impedances matching. This is the most efficient way as at any other setting the power dissipated in one or the other will not be optimum.

Here is an exercise we get the students to do on a course to demonstrate the principle (Jacobi's Theorum).

This is an exercise question. The purpose of this exercise is to demonstrate a VERY important MUST KNOW concept. I hope for you to discover the concept for yourself. (It does not only apply to batteries.) All cells (or batteries) have an internal resistance. So when you connect a battery to a load the equivalent circuit is a battery and two resistors in series. One resistor represents the internal resistance of the battery and the other represents the load.

So take any battery, to make the math easy I would give it a nice round voltage such as 10 volts.

Now draw two resistors connected to the battery in series with each other.

One resistor represents the internal resistance of the battery and the other is the load. (The load is the device the battery is supplying power too)

I would choose an easy resistance, say 10 ohms. (10 ohms is a ridiculously high internal resistance but that is not the object here.)

So if you chose my suggested values you would have a 10 Volt battery connected in series with two 10 Ohm resistors. Rinternal is the internal resistance of the battery which does not change and Rload is the load resistance.

Now calculate the power in watts dissipated in the load resistor (Rload)

Method:
? Add the resistances together to get the total resistance.
? Find the total current. (I=E/R)
? Find the power dissipated in Rload by using P = I2 * Rload

Now INCREASE the load resistor (Rload) so that is higher than Rinternal and calculate the power in watts dissipated in the load again. Make a note of it.

Now DECREASE the load resistor (Rload) so that it is lower than Rinternal and calculate the power in watts dissipated in Rload. Make a note of it.

Compare the three results.

1. When the load resistance (Rload) is equal to the internal resistance of the battery (the source).
2. When the load resistance (Rload) is greater than the internal resistance of the source.
3. When the load resistance (Rload) is less than the internal resistance of the source.

From this exercise it can be seen that, only when the source and load resistances are the same, will the maximum power be transferred. If the load is higher or lower than the source less power will be transferred than the maximum possible. if the load is lower, the source will be overloaded as it will be called on to deliver more than it was designed for and if the load is higher the source will not be caled on to deliver as much as it is designed to so either way it is not delivering the most it can to the load.

Efficiency is not really a term that can be used in this situation as we are trying to get all the power we are generating in the transmitter into the antenna and therefore out onto the airwaves. Efficiency is only valid in relation to the amount of power that we have to put into the transmitter to achieve the required output so, for instance, if we have a 100W transmitter which draws 200W from the power supply to achieve this output then it is 50% efficient but if we have one which needs the same 200W input but only gives us 50W out, then it is only 25% efficient. This is normally governed by the type of amplifier we are using.

I understand the maximum power transfer theorem, I studied it in college, and for small signal applications you want maximum power transfer. For any kind of power transfer, be it AC, DC or RF, you want the source impedance to be much lower than the load impedance. The maximum power transfer theorem still holds, but you want the power in the load , not in the source generating heat. The same hold for batteries. IT holds for generators and it holds for RF power amplifiers and final output stages.

Here is the wikipedia explanation
http://en.wikipedia.org/wiki/Maximum_power_theorem

24909. I need some help setting power output...

Yahoo group: FT897 (2009)
Date: 2009-02-06 04:15:05 UTC
From: Tom
Topic: 24909 Message: 24909

Hello fellow hams!!!
OK...I need a little help understanding how to LIMIT my power output across all HF bands to 20 watts.
Now, I have read the manual and, from what I understand, I can certainly lower my power output power from the 100 watt default setting BUT I can't quite figure out how to do this.
Example: I want to transmit on 20 meters. I want to use 20 watts only. (I am using an TEMPORARY antenna that can accept NO MORE than 20 watts PEP.) (I am in the process of getting materials together in order to build a homebrew 20 meter dipole even as we speak...BUT I want to try to get on the air a.s.a.p.)
Is there a simple way for me to re-set the default output power to 20 watts (across all HF bands?)
My apologize in advance IF this seems like a DUMB question BUT, well, I must be missing something in the manual!!
Thanks...Gracias...well, you get my point and my gratitude for your help with this! Also...although I love electronics and all things pertaining to radio, I am somewhat challenged when it comes to deciphering the *$%*! user manual!! :)
Thanks and of course...
'73s!!!
(also blessings! Can't help that...that is my "minister" coming out!)

THe object is to get the frequency to work first then save it.
Alternately you can put the frequencies in and when you use them, make
the corrections needed and re save them. So if you break it down into
the modules, /1. set up the frequency to save and 2. the actual saving,
while number 1 will change depending on what band you are on, number 2
will always be the same procedure.

Thats my story and I'm stickin to it.

Go to menu setting #75 and it will allow you to set your output to 20 watts (or whatever you want up to 100.
Once you selct that menu:

Push "F" in for a second or so until "Menu Mode comes up on screen.

Turn Mem/vfo ch knob until "No=075" is displayed on right top corner of the screen.

Turn the MAIN tuning knob to the power you want.

When you have 20 on the screen push the "F" button in again for a second and it will be set.

Bill,
email me if you have trouble or more ???

Subject: [FT897] Re: I need some help setting power output...

> Tom KC8TBY

Go to menu setting #75 and it will allow you to set your output to 20
watts (or whatever you want up to 100.
Once you selct that menu:

Push "F" in for a second or so until "Menu Mode comes up on screen.

Turn Mem/vfo ch knob until "No=075" is displayed on right top corner of
the screen.

Turn the MAIN tuning knob to the power you want.

When you have 20 on the screen push the "F" button in again for a
second and it will be set.

Bill,
email me if you have trouble or more ???

Hi Larry, I agree completely with using the RT programming.
I re-programmed 150+ freq from a file here on this forum and it
replaced all my small memories that are painstaking to enter.
Not only did it fill 150+ in all 11 banks it also opened my 897D
TX/RX completely up.
Sure surprised me,but a nice surprise.
Only way to go.
You don't happen to use RT for the IC-7000 do you? And, if you do,
how does it compare with programming the 897D?
Thanks and 73's, Bill

No, Bill, I don't have an IC-7000. A friend of mine does, but he hasn't gotten the RT software yet. So I have no idea how it works for Icom.

From: Eric van de Weyer
Topic: 24802 Message: 24915

Well, I suggest to him then that he goes back and re-reads it himself and corrects the several glaring errors in it. For instance 68F is NOT 26C, it is 20C. An SWR of 1.5:1 is not a loss of 14dB. A loss of 14dB would mean less than 1/20 of the input power getting to the output.

73....Eric VK2VE.

Here is a good link explaining impedance, also, from my friend Bill Lieske's site. And I would say he knows a little about antennas.

http://www.emrcorp.com/techinfo.html Read, or download/save "The Fifty ohm Enigma".

Bill's company not only makes commercial antenna gear, duplexers, etc, but Bill is one heck of a good saxphonist, too, which is how I know him.

Actually, if you read the wiki article, is supports what I have said.

If you take a 100W transmitter with a 50Ω output impedance to a 50Ω load, you will get 100W transferred to the load. If you reduce the load to 25Ω you will now get somewhere in the order of 50W into the load and if you increase the load to 100Ω you will also get about 50W to the load so as you can see, only when the source and load match will you actually get the 100W transferred to the load.

Remember that in this case we are not looking at efficiency but at the maximum transfer of the output of the transmitter to the load. You cannot talk about maximum power transfer and maximum efficiency in the same discussion as they are two different things and cannot be compared.

73....Eric VK2VE.

I understand the maximum power transfer theorem, I studied it in

college, and for small signal applications you want maximum power

transfer. For any kind of power transfer, be it AC, DC or RF, you want

the source impedance to be much lower than the load impedance. The

maximum power transfer theorem still holds, but you want the power in

the load , not in the source generating heat. The same hold for

batteries. IT holds for generators and it holds for RF power amplifiers

and final output stages.

Here is the wikipedia explanation

http://en.wikipedia.org/wiki/Maximum_power_theorem

24917. Re: [FT897] Re: Tuner SWR or Radio SWR

Yahoo group: FT897 (2009)
Date: Unix timestamp -125531894632 [implausible archived timestamp]
From: Jim
Topic: 24802 Message: 24917

Yes, if you have a transmitter with a 50 ohm impedance acting as a voltage source putting 70.7 volts on the 50 ohm transmission line and a 50 ohm load, there will be 100 watts dissipated in the load and 50 in the transmitter, and you get maximum power transfer. (Assuming no losses in the T line). So 100 watts in transmitter + 100 watts in antenna = 200 watts total in dissipated power. That is the theorem. You would have to put 200 watts in the transmitter to get 100 watts out of the antenna. Your meters would read 200 watts on the transmitter and you get 100 watts out the antenna.

However, if you change it the other way from your illustration, and change the transmitter to a 25 ohm impedance, the transmitter can still put out 70.7 volts, and 100 watts will be dissipated in the load but the amount of heat dissipated in the transmitter will be less than 100 watts. For example, 100 watts into a 50 ohm load is a voltage of about 70.7 volts. That same 70.7 volts is also generating heat loss in the 25 ohm transmitter impedance, so it is only putting out 50 watts in heat and the total heat dissipated is 150 watts. SO, you put 150 watts into the transmitter instead of 200 and you still get 100 watts out the antenna. If you could get the transmitter output impedance down to 5 ohms, it would dissipate 22.3 watts and the total power input the the transmitter would be 122.3 watts to get 100 watts out of the antenna.

The formula for power is Power = Voltage squared / Impedance.

You can go through the same exercise using currents if you wish/ the formula is :
Power = Current squared x Impedance. In either case, both the antenna and the transmitter will see the same voltage and current as each other.

Now on receive, you are dealing with small signal situation and you want the receiver to match the 50 ohms of the line because you need the maximum power transferred.

Hopefully this is a bit clearer now. Go through the math and see for yourself how much total power you have to put into the transmitter to get 100 watts out of a 50 ohm antenna with different transmitter impedances. Bottom line is the receiver should match the feed line , the transmitter should be lower in its internal impedance. to get maximum power out the antenna compared to what you put into the transmitter.

Uhm I think you are wrong with your statement that we are looking at maximum
power
transfer and not at efficiency. This may be true for low-power environments
but certainly
not for power transmitters. There the objective is to get a certain amount
of power out
(100 watts seems to be a popular value for ham radios..) with maximum
efficiency. And
for maximum efficiency the internal resistance must be as low as possible.
I remember a QST article from some time ago where they actually measured the
internal resistance of a ham transmitter. IIRC it was somewhere in the
neighbourhoud
of 10 Ohms.

Is there another side of this to consider? Does the phase of the reflected signal matter? Depending on the frequency and distance to the mismatch, won't the phase of the reflected signal either add or subtract from the transmitted one? Isn't consistency in power across frequencies important?

That is what the tuner is for, so the radio sees a match at the
feedline/ antenna junction and the antenna system is resonate and power
isn't reflected back into the radio. If it is reflected back the
missmatch at the transmitter should reflect part of it back up the line
to the antenna.

But, if I'm understanding the arguments here, some are saying that the transmitter should have a lower impedance than 50Ω. If that is true, the mismatch would occur at the junction between the transmitter and the feedline to the tuner. The problems would start even before the tuner. Also, feeding a 50Ω feedline to a an antenna that has 50Ω at the used frequency would also require a tuner. It doesn't sound right to me.

Back to the original topic then, the mismatch between the two SWR meters.

First: in a transmission line the SWR is the same in every point, provided that:

- the line is lossless

- the line does not radiate

- The impedance is the same along the transmission line

So in a perfect coaxial line the measured SWR is the same in every point.

Now, losses mean that in practice the SWR is the highest at the antenna feedpoint (assuming the end of the coax feeds a radiator). At the rig the SWR (read reflected power wrt forward power) is lower because some of the reflected power is dissipated on the way back.

In de OP’s case line loss cannot be the reason for the mismatch between the two meters because the SWR is not consistently lower at the MFJ. Besides, the difference it too big to be caused by line losses (probably less than a meter of coax at HF frequencies).

Patch between rig and tuner radiating: Possible, if there is no good defined common HF ground _AND_ the coax between the rig and the MFJ is not too short compared to the wavelength (> 1/10). Unlikely again.

Impedance problems: most likely cause in my opinion. Possible the patch is not 50 Ohm, or there are connector problems, impedance bumps along the rig/patch/tuner/tuner SWR meter _and/or_ inaccurate meter at the MFJ. Often the SWR meters in these tuners cut some corners to save a few cents.

Use the SWR value at the rig. All meters are very good at detecting 1:1 SWR and this is what the rig wants to see to output full power. That the SWR is not 1:1 further down the line is not so important (only for losses).

Pity however that the MFJ sometimes disagrees because this makes it very difficult to use the autotuner at these frequencies…

Minto pa3bca

24923. question concerning power output...

Yahoo group: FT897 (2009)
Date: 2009-02-09 21:54:01 UTC
From: Tom
Topic: 24923 Message: 24923

I have the 897D with the internal power supply installed. I have the rig hooked up to a Par Electronics 20 meter end-fed dipole antenna. I have the radio set at the default setting for 100 watts output power. OK...here comes the question:
When I transmit on SSB phone the power meter on the rig only seems to register a reading on the bar graph only about one half of the way across that graph. I would think that this means I am not getting a full 100 watts out. Am I correct or am I missing something here? Also... I, and a more experienced ham, hooked up an MFJ SWR meter which shows between a 1.3 and a 1.6 SWR on transmit. If I am correct I should be getting no less than 93% of my signal out off the antenna. So...my antenna seems to be working fine anyway. It is just the forward power out that has me a bit confused. :)
Why then isn't my rig's meter indicating a full 100 watts out?
Or is it???
Thanks in advance for your help once again folks!

Meters are notoriously inaccurate when trying to read peaks on SSB signals. If you're getting 100 watts CW, you're fine. The output is gonna be all over the place on SSB and the RF output envelope follows the modulating audio. Since the output is is all over the place, an average reading meter will average the power reading.

Check it on CW and if that looks good I wouldn't worry about it.

Hi TOM
Look at the forward power reading on the SWR meter in FM mode, that will be the power going to the antenna, The reflected reading on the SWR meter is the power which is reflected ???

You really need to do the CW into a dummy load to take the antenna out of the equation. All checking should be into a dummy load.

You can't tell much from an ssb transmission because it varies with the modulation. Do your test using a CW carrier.

The bar graph meter does not show full pwr on ssb. Switch to FM and key the mike and you will see your power out of the radio. A nice external meter that will show you pwr,swr modulation and vdc is the LDG 897 meter. Very reasonable check it out.

At the 100W SSB setting, you should get about 50 W out
peak, max-- depending on your audio gain settings.
Any more and you are probably Flat-topping and garbling
your audio.

That's the way SSB works!

If you want to see FULL 100 watts power .. switch to CW.

Have fun..good DX...

Noooo! That is not how SSB works. SSB is simply an audio signal shifted up in frequency from baseband 300-2400Hz to (say) 14,100,300 to 14,102,400 Hz by the addition of 14,100,000 Hz. The signal envelope will/should be exactly the same!

If the amplifier is capable of 100W output, the peaks will reach 100W, and IF the amplifier is properly designed, there will be no flat topping or any other nonlinearity effects.

However, if a typical ham power meter is connected, then, given the average voice, the average power will be around 30W. If you use a proper SSB peak reading power meter, like an oscilloscope, then you will see 100W.

From: Tom
Topic: 24923 Message: 24932

Once again you folks have answered my question in quite a bit of detail!
Sounds like everything is fine...I haven't try checking my power on CW
or FM but I will.
As per a few of your answers, on SSB I do see a "fluctuation" on the
power meter depending on my voice level, etc. Sounds like that is what
it SHOULD be doing.
I have indeed made contacts as far away as Alberta and Colorado...I am
in Michigan...and they have given me a 5/9 signal report. So I am
getting more assurance that my rig is operating as it should.
You know . just because I studied and passed a test for general class
it doesn't mean that I have either the experience OR the knowledge to
understand what (sometimes) must seem like the "basics" of radio
operation and theory. That's why I, (and some others I'm sure!),
turn to all of you "Elmers" out there and we learn from your vast
library of knowledge and experience.
In other words...
Thanks!

24934. Re: No modulation

Yahoo group: FT897 (2009)
Date: 2009-02-05 11:48:48 UTC
From: Sam Saladino
Topic: 24828 Message: 24934

Sometimes when trying to figure out a problem we become frustrated and overlook things we may not normally.

When you have the CW Key connected you said there was a tone, but no transmit power. Did you change the display menu to MFj and push on the middle button under BK on the display so that it's shown in brackets? Unless that was done the only thing you'll hear is the sidetone and there will be no transmitted power.

--- In FT897@yahoogroups.com, "JAMES AMBURN" <james.amburn@...> wrote:
>
> Thanks Peter,
> You are correct. No audio transmitted in any mode. I connected a key and in cw mode I get a tone but no transmit power. I tried keying the mike and then the key and I can transmit code in to a dummy load and see the power out on the external power
> meter. I had not tried this operation before. I still can not modulate the carrier in AM, FM or SSB. I do get a carrier in AM and FM mode when I key the mike. This could indicate a transmit relay problem in that the mike output is not being switched with the mike button depressed. Does any one else have a suggestion?

From: simon.worsley
Topic: 24937 Message: 24937

Hi all,

Just wondered what peoples views were on installing more than one vertical antenna on one aluminium mast?

Ie a Comet GP9 which is a high gain 2&70 antenna installed in the normal way on a 20foot ali pole, but also installed on the same pole another antenna, ie a Diamond V200 which is a tri-band colinear, 6, 2 and 70

What are your views?

Hello Tom,

When I read, that you are using and INTERNAL POWER SUPPY.
The internal P.S. that is used on the FT897 is a Battery Pack.
and when that is used... the radio performs an automatic power
shift to 20 Watts.

The 100 Watt function is normal when using an external power supply.

I have the 897D with the internal power supply installed. I have the

rig hooked up to a Par Electronics 20 meter end-fed dipole antenna.

I have the radio set at the default setting for 100 watts output power.

OK...here comes the question:

When I transmit on SSB phone the power meter on the rig only seems to

register a reading on the bar graph only about one half of the way

across that graph. I would think that this means I am not getting a

full 100 watts out. Am I correct or am I missing something here? Also...

I, and a more experienced ham, hooked up an MFJ SWR meter which shows

between a 1.3 and a 1.6 SWR on transmit. If I am correct I should be

getting no less than 93% of my signal out off the antenna. So...my

antenna seems to be working fine anyway. It is just the forward power

out that has me a bit confused. :)

Why then isn't my rig's meter indicating a full 100 watts out?

Or is it???

Thanks in advance for your help once again folks!

Hi TOM

Look at the forward power reading on the SWR meter in FM mode, that will be the power going to the antenna, The reflected reading on the SWR meter is the power which is reflected ???

When I was in Sydney a few years ago I found 2Mtrs completely wiped out by pager sigs. I was using a Kenwood hand held and my call of VK4CXO. Happily I was also mainly maritime mobile as G0RDO/MM on 20M QRP and had lots of fun QSO's.
It seems that pagers rule in Sydney.

24949. Re: question concerning power output...

Yahoo group: FT897 (2009)
Date: 2009-02-10 16:49:19 UTC
From: Fred
Topic: 24923 Message: 24949

Hello Tom,
As I read the note, I see you saying that you have the INTERNAL POWER SUPPLY installed... are saying that you have the FNB-78 Battery Pack installed?????
If That is what you are saying.... then the Radio will automaticly shift to an output of 20 watts.

If you have the FP-30 Power Supply ATTACHED to the bottom of the Radio... then you should be getting an output of 100 Watts

Good Luck,
Fred,
WE7M

DE N7UVL,
The posting on-line is directly affected by the
efficiency of the Examining Team's process
for submitting the exam results. If the Examining
Team submits their results via internet right away,
the posting will happen pretty fast. However,
if they snail mail their results in, the whole
process is slowed down as the results will then
have to be manually entered first./ga

Yes, look on ebay. You can also download a tone generator for your computer and play the tones through your speakers.

Is there a way to program DTMF tones without the need to buy the fancy mike? Didn't there used to be tone generators you could use on telephones?

Tnx

There is also an optional INTERNAL mains supply that allows 100W o/p.

From: Eric van de Weyer
Topic: 24866 Message: 24954

Hi John,

Yes, the pagers are quite a problem here in Sydney. We have overcome them to some extent by using CTCSS (123Hz) on the input of our local repeaters in the eastern suburbs. They also put out the CTCSS on the output of the 2m one so that people can use the tone squelch feature in their radios. This was originally done for me as I used to drive right through the CBD going to and from work and it used to really frustrate me.

I have also played with a 1/4 wave stub as a filter to help get rid of some of the pager interference and that also worked quite well but, because they are relatively wide, they also tend to look like a short at the TX frequency as my TX frequency was just under 400kHz from the pagers. I made up a little relay switch which was connected to the PTT line and switched the stub out of circuit during transmissions.

We still manage to get by.

73....Eric VK2VE.

When I was in Sydney a few years ago I found 2Mtrs completely wiped out by pager sigs. I was using a Kenwood hand held and my call of VK4CXO. Happily I was also mainly maritime mobile as G0RDO/MM on 20M QRP and had lots of fun QSO's.
It seems that pagers rule in Sydney.

We used to take an old telephone key pad and convert that with a 9 volt battery and a cord with a 1/8th in ,mono phone plug on it, Then we would modify the mike and add a 1/8th in mono jack to plug in the mike circuit when we wanted to use the phone patch. Later I got a Drake EM1525 to use and it had the built in keypad with the numbers 0 through9.I still have the mike.

Congratulation on passing the exam and earning your technician license! Welcome also to the hobby and to this group as well!
I would recommend that you check out the web site QRZ.com. This is a wonderful web site dedicated to all aspects of the ham radio and, most importantly to you, it has a link that allows you to see all "newly issued licenses", (almost) as soon as they are processed by the FCC.
Keep in mind, however, that the FCC is a pretty large beauacracy and as such it sometimes can act a bit slowly. I have never heard of someone having to wait longer than a few weeks however.
Here's the link:
http://www.qrz.com/index.html
Best of luck and let me add my encouragement to you to keep on studying and learning more about radio, propagation, electronics, etc. Move up to general and maybe to extra as well!
Above all, have fun!
Hope to hear you on the air one of these days!
'73!

s.wood34,

It is also of course dependant upon how many applications the FCC received in the same time frame as yours. From what I have seen lately however the time frame given to you by the examiners is pretty close to what is happening though maybe a day or so optomistic.

One additional thing to note is that QRZ's database (which many people look for it on) is updated only in the morning, so lags behind the FCC's search engine by up to 24 hours. For the absolute quickest info make sure you search directly on the FCC web site by your name http://wireless2.fcc.gov/UlsApp/UlsSearch/searchLicense.jsp

Wellcome to the hobby, hope you have many years of pleasure and hope to someday have a QSO with you....

From: Rob - W1AEX
Topic: 24936 Message: 24964

Hi,

I put a GP-15 on top of my tower back in the summer of 2006. It has performed very well in all weather on 6m/2m/440 without any issues at all. I use it on all three bands with the 897D and also an FT-8900. It also does a fine job of listening on the aircraft band, marine band, and all my local public service frequencies. I would recommend it without any hesitation at all.

Yep, you can see if you can find some of the hand held tone generators. I owned one about 20 years ago. Back then, Radio Shack used to sell them.

You could always find one of these

http://cgi.ebay.com/WESTERN-ELECTRIC-STAND-ALONE-TOUCH-TONE-DIAL-PAD_W0QQitemZ270341103423QQcmdZViewItemQQptZCorded_Phones?hash=item270341103423
<http://cgi.ebay.com/WESTERN-ELECTRIC-STAND-ALONE-TOUCH-TONE-DIAL-PAD_W0QQitemZ270341103423QQcmdZViewItemQQptZCorded_Phones?hash=item270341103423&_trksid=p3286.c0.m14&_trkparms=72:1205|66:2|65:12|39:1|240:1318|301:0|293:1|294:50
>
&_trksid=p3286.c0.m14&_trkparms=72:1205|66:2|65:12|39:1|240:1318|301:0|293:1|294:50

and wire it up.

Good luck.

Subject: [FT897] DTMF tones without Microphone?

Is there a way to program DTMF tones without the need to buy the fancy mike? Didn't there used to be tone generators you could use on telephones?

Tnx

From: George
Topic: 24780 Message: 24967

In response to the SSB filters - I preface this reply with the note
that I have not installed either, but I have heard many reports here
on this forum that the 2.3 filter does not really give much advantage
over the built in DSP software filters. You can gain some advantage
by useing the available 2.0 filter from Inrad, though whether that
gain is worth the cost (about $125 I think) is worth it or not has
been debated.

You can use two different filters for CW or SSB and dont have to have
one for CW and one for SSB just as an FYI

Hi All...

Thanks for any help you can give....

I have just purchased a MH-36E8J DTMF Mic for my Radio:-

Question....Is there any way of programming the A & B Buttons to any thing other than the "running man" Tcall or repeater shift would be good....Any clues welcome?

If any thing can be done?

Thank you 73's de Andy G7IIF

24970. RE: [FT897] question concerning power output...

Yahoo group: FT897 (2009)
Date: 2009-02-11 06:38:13 UTC
From: Brian Tucker
Topic: 24923 Message: 24970

Fred,

I believe he's referring to the FP-30 internal power supply that is
available for the FT-897, which can be installed instead of the batteries.
In this configuration, the radio will in fact transmit at 100 watts.

As for the question, as SSB power is dependent upon the amplitude of the
signal, it may be in order to check the mic gain and also check the
modulation of the signal. Do you by chance have an external power meter
that you can validate against?

Brian

Subject: Re: [FT897] question concerning power output...

Hello Tom,

When I read, that you are using and INTERNAL POWER SUPPY.
The internal P.S. that is used on the FT897 is a Battery Pack.
and when that is used... the radio performs an automatic power
shift to 20 Watts.

The 100 Watt function is normal when using an external power supply.

Fred
WE7M

Subject: [FT897] question concerning power output...
To: FT897@yahoogroups.com <mailto:FT897%40yahoogroups.com>
Date: Monday, February 9, 2009, 3:54 PM

I have the 897D with the internal power supply installed. I have the

rig hooked up to a Par Electronics 20 meter end-fed dipole antenna.

I have the radio set at the default setting for 100 watts output power.

OK...here comes the question:

When I transmit on SSB phone the power meter on the rig only seems to

register a reading on the bar graph only about one half of the way across that graph. I would think that this means I am not getting a full 100 watts out. Am I correct or am I missing something here? Also... I, and a more experienced ham, hooked up an MFJ SWR meter which shows between a 1.3 and a 1.6 SWR on transmit. If I am correct I should be getting no less than 93% of my signal out off the antenna. So...my antenna seems to be working fine anyway. It is just the forward power out that has me a bit confused. :)

Why then isn't my rig's meter indicating a full 100 watts out?

Or is it???

Thanks in advance for your help once again folks!

'73!!

If you're talking about the A-D buttons on the right side of the mic, the A-C are set the same as the last row on the radio (the programmable keys). There are three other keys on the mic that you can program. These are set using menu options 65-70, page 55 in the manual will get you started.

From: Dave AA6YQ
Topic: 24973 Message: 24975

DXLab supports the FT897. Its free, and available via www.dxlabsuite.com

Besides the usual logging, transceiver control, DX spot collection and digital mode features you'll find in most applications, DXLab

- controls up to 4 transceivers, with optional transceiver selection by frequency

- provides 10 banks of 10 memories, with the ability to continuously scan a bank's frequencies

- displays frequency-dependent settings for devices like tuners, amplifiers, and antenna switches, with optional control via parallel port signals

- supports transverters for 6m, 4m, 2m, and 70cm operation

- provides user-defined transceiver control sequences initiated by buttons and sliders

- provides both map-driven and callsign-driven operation of all commercial PC-controllable rotators

- tracks confirmation and verification of QSOs for DXCC and TopList awards, highlighting needed DX spots, automatically generating outgoing QSLs that request confirmation of needed QSLs, identifying confirmed QSOs for submission to the ARRL DXCC desk, and generating DXCC submission paperwork

- reports progress towards DXCC, TopList, Challenge, VUCC, Marathon, WAS, WAC, IOTA, WAZ, WPX, USA-CA, DOK, WAE, RDA, JARL, and WAB awards

- extracts address information from all 3 CDROM callbooks and QRZ.com (free with advertising, or no advertising with subscription)

- provides one-click access to more than 80 web-accessible sources of QSL information

- directly prints QSL labels and 4-to-a-page QSL cards

- directly prints addresses on envelopes or labels

- provides operations that can alter many logged QSOs simultaneously without requiring the user to modify ADIF files -- e.g. performing callbook lookups on already-logged QSOs, or adjusting the start times of QSOs logged during a specific time range, or extracting QTH information from COMMENT fields, or...

- synchronizes with LotW and eQSL.cc, initiating upload and download operations with a single mouse click without requiring the user to manually invoke TQSL

- captures DX spots from up to 6 sources (telnet clusters, packetclusters, DX Summit), creating and maintaining a local database with one entry for each active DX station that is color coded by "need" and LotW participation, and whose entries can be independently filtered and displayed in a table, on its world map, and on a zoomable bandspread

- extracts QSX frequencies from DX spot notes, enabling accurate transceiver setup for split frequency operation with one user action

- captures solar and geomagnetic data from WWV spots and uses this data to display easy-to-understand QST-style graphical propagation forecasts, and to depict the auroral oval on its world map (choice of VOACAP, ICEPAC, or IONCAP propagation forcasting engines)

- monitors user-specified NCDXF/IARU HF beacon schedules to rapidly calibrate propagation forecasts with actual propagation

- decodes all PSK31 or PSK63 or PSK125 QSOs within your transceiver's bandpass and extract callsigns to create and maintain a "stations heard" window

- simultaneously runs soundcard RTTY (using the MMTTY engine) and an external modem (e.g. a KAM or PK232) to provide diversity decoding or the ability to simultaneously decode a DX station and callers

- supports PSK, RTTY, CW (generation only), and Phone (voice keying) with a single user interface and macro facility

- interoperates with with MultiPSK, MMSSTV, MMVARI, MMTTY, MixW, Fldigi, DM780, HRD, and DX Atlas

- is updated frequently, and downloads/installs upgrades with a single mouse click

- is driven by an active and friendly user community open to everyone

73,

Dave, AA6YQ

From: Bill
Topic: 24981 Message: 24981

Howdy gang.
I have added a mail order form to the files area where all the TiniCAT drawings are located. We all know the economy is slow and $ are tight. By using mail order with a check I can pass along the savings of the Paypal fees that I would incure if one ordered from the website. This savings is not huge however it will help and is one way I can lower the cost. As always I encourage home brew of the design and support home brewers by email nights and weekends regardless if you purchase any parts from me or not. email for this support is techhelp@... All the drawings to home brew one along with a parts list with supplier names is in this group's files section. This discount is only for Yahoo group members for bare P.C. boards, kits and built and tested units shown on the form.
A slide show of what a completed TiniCAT CAT level converter and sound card interface looks like and how to plug and play can be found here http://www.n5ztw.com/FT-897.htm There are hundreds in use today. Please email me any photos of your home brew version so I can add them to my web site.
See you on the waterfall.

24983. Radio loocked

Yahoo group: FT897 (2009)
Date: 2009-02-15 02:22:21 UTC
From: py4xx
Topic: 24983 Message: 24983

Hi all...

My radio was working well today in WPX RTTY, when suddenly, he
stopped ...

I tried several things but nothing ...

Now the situation is as follows:

The VFO button - normal
League off - normal
mem / ch VFO - Normal
V / M - Normal
HOME - Normal
DSP - Normal
MODE - Not working
BAND - Not working
AF / SQL - Normal
CLARIFIES - Normal
Function button - normal
Menu - normal
PTT - No work
CAT - some command works, but MODE and BAND do not work

Can you give me a hint on how to unlock?

Thanks

Carlos Alberto

I know this may sound silly but do you have the "LOCK"
feature enabled?
Menu 054 selects how far the rig will lock out when "lock"
is selected.
Dial Freq Entire panel or ALL
Perhaps you hit the lock key?

Date: 2009-02-15 04:13:05 UTC
From: Larry D. Barr, K5WLF
Topic: 24986 Message: 24986

I just installed a Buxcomm 8010CD in 'cloud warmer' configuration today.
On some frequencies my AT-897 is hanging and keeping the FT-897D in XMIT
mode.

It doesn't happen with the Hustler 5-BTV on the same freqs.

Anybody else ever had this happen?

Hi ...

I discovered what was happening with the radio. It was my electronic Keyer
(K10), which came in short, and blocked the route of transmission of radio
...

Good, that was just remove the plug of the keyer, and radio back to work
again ...

24990. FT-897 second menu - also known as hidden menu

Yahoo group: FT897 (2009)
Date: 2009-02-14 15:27:24 UTC
From: mpsrepman
Topic: 24990 Message: 24990

Hi,
I have recently acquired an FT-897. I have tried to access the hidden menus (I have shown ext menu 1 as ON). When I hit A,B,C and power then the func for half a second I do not get access the the hidden menus. Can anyone help me to get in to them as I think the former owner messed them up.
Thanks,
James G0SDB

24991. Re: [FT897] FT-897 second menu - also known as hidden menu

From: kc3vo@aol.com
Topic: 24990 Message: 24991

You are ALSO likely to mess them up, by failing to follow YAESU directions. BEFORE you make the attempt, you are to be certain of supplying 13.8 volts, (not 13.1, not 14.5, not 12.7, but a regulated 13.8 volts) to the radio! This voltage should be set to 13.8 volts, with an error of 1/10 volt or less, measured at the supplied power cable, with radio on, in receive mode. The voltage level is used as a reference to set the service menu. Do NOT press the "function" key until AFTER you finish making observations/adjustments, but REMEMBER: these settings are different for EACH radio, there are no "default" settings, and there is no "auto-restore" if screwed up! To properly adjust these settings, you need the YAESU service manual, tools, technical skills, and much test equipment.--CAREFUL, and good luck!--73, KC3VO, Bob Curry

Hi James,

Bob's warnings are on target. Approach the service menu with caution.

If your 897 is connected to your computer, there is a simpler way to look at your service menu settings. In the files section of this group, there is a utility called "Modify.zip" that will allow you to view all the service menu settings of your 897.

It will also allow you to save (back-up) all your unique service menu settings to your hard drive. The utility also has the ability to change service menu settings on the fly as well, but as Bob has warned you, don't do this without fully understanding what is going on. Your radio has unique settings that were set to optimum values for the combination of components in your 897.

James,

One other thought. After examining your own service menu settings, you might want to look at a collection of service menu settings that Jochen, DG2IAQ has collected, purely for comparison purposes. He has this data at the following location:

http://www.qth.at/dg2iaq/mods/Yaesu%20FT-897%20Servicemenu%20+%20Internal%20Menu.zip

If the above link is broken, simply go to his site at the link below and navigate to the file named: Yaesu FT-897 Servicemenu + Internal Menu.zip

http://www.qth.at/dg2iaq/mods.htm

24994. unwanted DSP for digmod

Yahoo group: FT897 (2009)
Date: 2009-02-15 10:25:20 UTC
From: obotka
Topic: 24994 Message: 24994

Hi people,

I found the use of DSP set to BOTH (menu 48) to be adequate for my voice. In SSB mode and pressing PPT, a green LED turns on; depressing PTT, it turns off.

Fine. Ii is working. Now I change TX mode to DIG. I leave PTT unused and start a transmition using a PC. The DSP LED turns on.

DSP from menu 48 is intended for voice improvement. I don´t want it changing characteristics of the digital tones.

Have I to go to menu 48 every time I change from SSB to DIG modes?

Thanks,

Otavio, PY4OLB.

24995. Re: CT-39a wirring diagram

I am trying to connect the FT 897 to the PC by using the CT-39A cable.

Can anyone please advise me on the following.

1) Can the CT-39a be connected to the PC thru an RS232 (9 pin) via USB
2) where can i find or get the wiring diagram for the RS232 with the CT-39A.
3) is there any setting thats is require to do on the FT 897 using the CT-39A

Thanks you

Have a pleasent day

Hello George,

The amount of power you can use in these antennas is governed by the type of capatitor used. The higher the voltage rating, the more power.

You don't need a tuner for the antenna, but, if constructed properly, yiu will need to retune the antenna every time you change frquency.. This means that if you site the antenna away from your radio then you will need some sort of remote motorised control over the tunuing of the antenna. I curently have one of these in the loft now and can confirm that they give excellent results for their size. It works a lot better than I was expecting!

Hope this helps,

Paul.

Hi George,

I agree with Paul. I just want to stress that you do NOT want to use a tuner with a magnetic loop antenna, or any small, hi-Q antenna for that matter. This type of antenna must be tuned at the antenna to maintain any decent efficiency. However, when properly adjusted it will do very well for you.

Hi George,
MFJ do make a tuner specially designed for mag loops, but the main problem is as mentioned by others, that you have to retune every time you change frequency, even a few Khz either way will result in needing a retune.
With that in mind, if you don't use a remote method of tuning, you will need a motor to tune a large capacitor for the loop, and I am in a similar situation, living in a restricted space building, this creates more problems even at 20 watts, the potential high voltages from a mag loop are dangerous, and manually tuning can make this an even greater hazard. My experience was the mag loop was more trouble than it was worth, and eventually I decided to go with a stealth type long wire, its amazing what you can hide away from neighbours etc when you really want to.

Hi Roger...and other good souls...

I know.... but I will control big air_cap with stepper motor from my
old printer.... I will remove a stepper motor from old printer and I will
control that air_cap with stepper mot. as a printer... I have to rewrite
printer driver.... I am also old software programmer... I will have a fun
for sure. But use mag.loop as a antenna is only one option for me...
20 Watts is max power I can use... I am sitting quite close (4 meters.)
from that loop...

George.

From: gardfire5
Topic: 25002 Message: 25002

I was wondering if anyone has every had any problems with the ATAS 120. I set all my stuff up today and when I pressed the tune button it would activate for a second then stop. I called Yaesu but they have not returned my call. Also if anyone has any suggestions for a new set up, I am renting so low profile is the way to go. I usually mount it on my car and just run an extension cord to power my 897. Thanks for the advice.

The biggest and most common problem with the ATAS 120 not tuning properly is because of an inadequate ground to the vehicle or whatever device it is mounted on. The ATAS 120 MUST have a GOOD ground, preferably using some type of braid.

Actually, it may not be tuning because of oxidation on the S0-239 (mount) or the 259 at the base of the antenna. A small amount DeOxit usually make the antenna play again.

I have two vehicles. One uses the older ATAS 100 and the other the ATAS 120. Both developed the same problem and the DeOxit resolved the problem.

I will try that if I can find it. I hope that the near by radio shack has it. I have been using it for the past month or so and I have not had any problems with it. I do not travel with the ATAS on my vehicle, I use a quadband that is my main antenna running to my 8900. Anyways i will try that and see where it takes me. Thanks again.

I have been using this antenna without problems for alittle over a month. For whatever reason today it would not tune. I will try some radials on it to see if that would help it out, I just don't know why it has been working with the same setup for the past month and then just all of a sudden it would not work. Thanks for the reply and I will try some form of new ground for it. 73

Go to Home Depot or Lowes or a hardware store. It is used for making
electrical connections so it should be in the electrical department.

Did you check your PTT button? The only time when I had a problem like that with the antenne was when the PTT button of the mike (MD100) was pressed on startup.

I was wondering if anyone has every had any problems with the ATAS 120. I set all my stuff up today and when I pressed the tune button it would activate for a second then stop. I called Yaesu but they have not returned my call. Also if anyone has any suggestions for a new set up, I am renting so low profile is the way to go. I usually mount it on my car and just run an extension cord to power my 897. Thanks for the advice.

No it was not pressed. Yaesu finally called me back he was leaning towards improper grounding. I have used the same set up for the past month and it was working fine. I was able to make a QSO to Europe last week so I guess I will try and look at the grounding to see if I can improve it. But as for the PTT it was not pressed.
Thanks 73

The ATAS antennas use the ground and the center conductor to supply DC voltage to operate the screwdriver tuning mechanism, in addition to suppling RF to the antenna. That is why the grounding is so important on them. IT might have been good earlier but it might have corroded or loosened up. check it out

I heard a great saying when it comes to ham radio, $1 worth of
antenna is $10 worth of radio. I was able to pull my car into the
station (Great thing about being a union fire fighter:) I was able to
clean my K400C and realized that the wire leading into my car had the
wires exposed. I will need to replace that part of the antenna mount
luckly I have a second one that I was using for a more "stable"
antenna set up. I just need to find a better way of getting the wire
into my car. That is going to be a fun project for when I get out of
work tomorrow especially with the snow storm that will be hitting
us. Oh well gotta love ham radio in winter time. Thanks for all the
advice and I will let you know how things work out. Hopefully we can
make a contact at some point in time. Thanks once again 73

25012. Cross band Operation

Yahoo group: FT897 (2009)
Date: 2009-02-19 09:05:28 UTC
From: Selva Kumar R
Topic: 25012 Message: 25012

I've been trying to figure out how to setup cross band operation using the feature available on 897, but have been unsuccessful at it so far. I need some help from the forum to set this up.

My intent is to use my HT (VX-5R) on UHF/VHF frequency to cross band into the local VHF repeater.

Pls suggest settings on the 897 required for me to get this up and running (Including the VXTR A/B settings I need to use). The info and explanation on the Manual in inadequate and useless !! Alternatively, explaining the theory behind the usage, will also be of great help. I can then go about figuring out the freq & settings.

Local repeater operates on 145.650 (-600kHz Shift).
My VHF/UHF port is connected to a dual Band Antenna (Diamond X710)

Tks in advance.

Going through the manual, I find no reference to crossband operation and, if memory serves, the 897 does not have that capability. You CAN operate in split-freq mode which you can use in different bands between vfoA and B.

Hello to all. The 897D (or non D) will operate cross band, not cross band repeat. There is a distinct difference in the two. Cross band ops, you have the mic in your hand and transmit on one freq and receive on the another, but not at the same time. Cross band repeat, you use the rig as a stand alone, transmitting to it. It then retransmits on a different freq simultainously. The FT-8900, 8800 and several other rigs do that. Very nice for ECOMM in remote areas....cliff....wb4dpp

To Selva Kumar
From Ron West / WB3ILX

Selva,

To my knowledge the FT-897 does not perform the crossband funtion in the manner in which you are thinking. The crossband the FT-897 does is only receiving on one frequency and then transmitting on another using the memories. True crossband to perform what you want would require you purchasing the FT-8800R which is a true crossband VHF/UHF radio. I recommend the FT-8800R as it is easy to program and I use it exactly the way you are intending. I go in on a 440 simplex frequency on the lowest power setting on my VX7R and program the FT-8800R for that simplex frequency and my local repeater frequency. The power settings on the FT-8800R are set for 5 Watts on both the 2m and 440 side to keep the rig from over heating. I use a small dual band antenna 12 ft. above the ground on a pole outside my house in the back yard. This arrangement permits me to use the HT/VX7R on low power and not have to worry about hitting the local repeater. There is a 2 second lag time in the FT-8800R so you key up the mic and wait 2 seconds before talking. This gives the radio time to switch from one mode to the other.

I hope this helps. The FT-897 does not perform crossband operations.

Your friend,
Ron West / WB3ILX

From: dyarnes1
Topic: 25002 Message: 25018

I was going to reply about grounding, but I felt sure someone else would do it first. The ATAS-120 is pretty finicky about how good your ground system is. Mine isn't great, in that it is only is grounded by my mount (a Diamond K400), but I did make sure that the set-screws go all the way through the paint, and I get good continuity to ground. When I first tried to install it, I didn't do a great job of getting the screws all the way down to the metal, and the antenna balked. Since then though, no problems.

25021. Cannot label optional 2.0khz filter

Yahoo group: FT897 (2009)
Date: 2009-02-20 02:02:45 UTC
From: kybarney
Topic: 25021 Message: 25021

Hello,

I just installed an Inrad 300hz CW filter and a 2.0khz SSB filter. The label for the CW filter came up as "300," however, the 2.0khz filter is labeled "2.3." Does anyone know if the 2.3 label can be changed to 2.0?

I found a post where someone said menu 64 works for labeling, but I don't know how to enter a label...

Any help is appreciated.

Hello to all. The 897D (or non D) will operate cross band, not cross band repeat. There is a distinct difference in the two. Cross band ops, you have the mic in your hand and transmit on one freq and receive on the another, but not at the same time. Cross band repeat, you use the rig as a stand alone, transmitting to it. It then retransmits on a different freq simultainously. The FT-8900, 8800 and several other rigs do that. Very nice for ECOMM in remote areas....cliff....wb4dpp

NO, crossband "REPEAT" and SPLIT OPS are 2 different animals.

With "CROSS-BAND REPEAT" you are essentially using the radio as a repeater. You would essentially be using an HT on, say 446.00 simplex into the "Mobile" or "Crossbanding radio" and that radio receives yor 446.00 transmission and re-transmits that signal out on a 2 meter frequency or vice/versa.

"Split Ops" is the radio you are using (the radio you actually have the mic for in your hand) and you listen on one frequency, say 18.160MHz, and when you key the mic, you transmit on say 18.175MHz. You can also listen on say 14.285 and transmit on 28.400 if you set the "split" that way, but, it is NOT cross-band repeating.

Does that make sense? I am kind of starting to confuse myself, too!!! LOL

25033. FP-30 Case

Yahoo group: FT897 (2009)
Date: 2009-02-17 19:54:32 UTC
From: ab9ta
Topic: 25033 Message: 25033

Since I've finally gotten relicensed, I've been looking at different radios, mainly the IC-706 and FT-897.

One thing I've been wondering about is if the case for the FP-30 is available as a part from Yaesu.
It occurs to me that with the extra room available by adding an empty FP-30 case, one could have room for an internal battery, AC power supply and a small tuner in one integrated case for the 897.

Also, does anyone know if when the internal battery is installed and an external DC supply is connected to the radio, will the internal battery receive a charge, or are the batteries isolated?

Thanks,
Bill

From: richardehead@ymail.com
Topic: 22093 Message: 25035

HI, all. I just bought a new 857D and cabled it up to an 80m dipole and an LDK AT100-Pro tuner. I used it to good effect on 10m last night, talking to my Elmer. When he suggested we switch to the 60m, channelized band, I could hear him but he couldn't hear me. When I keyed the mic I got "TX ERROR" in the display. Any ideas? I haven't had time to go completely through the manual but my Elmer has the 857D (same machine, different case) and he'd never seen that error.

Thanks.

Topic: 25002 Message: 25036

Patrick most problems in the past with the ATAS 120 antenna are related to not having a good ground at the base of the ant mount. All of my problems have been that. It is hard to get a good ground. The radio passes DC to the antenna motor via the coax, and good ground is absolutely necessary. So look there first. Some times the system requires the antenna to go to the full down position. I have found that some times I have to ask it to tune while on 6M then 10M etc to get it to tune to one of the lower HF bands. I hope some of this is of help.

Enjoy,
Bill / K5IXF

From: kd8jnh
Topic: 25037 Message: 25037

I am thinking of getting the MD100 mic for my 897/D . How ever I am wanting to mount it onto a boom i have made up from a work lamp arm .

Can the MD100 be set up on a foot switch with out having the base attached to it>? Also does any one know how well the mic works on the 897 to begin with ?

Thanks and 73's

Jerry

the 706 is a nice rig. Being able to separate the face from the unit is
a big advantage for mobile operation.

Yes the fp-30 is yaesu.

Can't getthe battery and the power supply in at the same time

From: D F
Topic: 22093 Message: 25042

I hope that is NOT your real name, but anyways,

You say you have the 857 (NOT the 897?). If so, this is easy. If you are in VFO mode, you CANNOT tx on 60m band because you can "tune" around different frequencies. However, if you are in MEMORY mode, as with mine, you will find the first 5 pre-programmed frequencies are the 60m "channels" that you can transmit on.

I have yet to figure exactly WHY Yaesu did it this way, but you should be able to get on 60m from memory mode.

However, IMO, 60m is a waste of time because of the restrictions. Those, again IMO, take the "fun" out of using that band, BUT, since the Alaska Emergency Frequency is there too, and because there are way too many MORONS on the HF bands, I can understand why the FCC limits your ability to use that band.

Hope this helps!

Subject: [FT897] TX ERROR

HI, all. I just bought a new 857D and cabled it up to an 80m dipole and an LDK AT100-Pro tuner. I used it to good effect on 10m last night, talking to my Elmer. When he suggested we switch to the 60m, channelized band, I could hear him but he couldn't hear me. When I keyed the mic I got "TX ERROR" in the display. Any ideas? I haven't had time to go completely through the manual but my Elmer has the 857D (same machine, different case) and he'd never seen that error.

Thanks.

To: FT897@yahoogroups.com
Subject: Re: [FT897] Cross band Operation

NO, crossband "REPEAT" and SPLIT OPS are 2 different animals.

With "CROSS-BAND REPEAT" you are essentially using the radio as a repeater. You would essentially be using an HT on, say 446.00 simplex into the "Mobile" or "Crossbanding radio" and that radio receives yor 446.00 transmission and re-transmits that signal out on a 2 meter frequency or vice/versa.

"Split Ops" is the radio you are using (the radio you actually have the mic for in your hand) and you listen on one frequency, say 18.160MHz, and when you key the mic, you transmit on say 18.175MHz. You can also listen on say 14.285 and transmit on 28.400 if you set the "split" that way, but, it is NOT cross-band repeating.

Does that make sense? I am kind of starting to confuse myself, too!!! LOL

Hello to all. The 897D (or non D) will operate cross band, not cross band repeat. There is a distinct difference in the two. Cross band ops, you have the mic in your hand and transmit on one freq and receive on the another, but not at the same time. Cross band repeat, you use the rig as a stand alone, transmitting to it. It then retransmits on a different freq simultainously. The FT-8900, 8800 and several other rigs do that. Very nice for ECOMM in remote areas....cliff. wb4dpp

From: Gavin Nesbitt
Topic: 25033 Message: 25051

Hi Bill,

Yaesu, in the UK at least, have a really good parts department and in the past I have been able to buy anything from them, they even offered my friend free replacments for lost volume knobs if he sent them an SAE! Hopefully they are the same in the US and if so I'm sure you can get the case from them, if not it wouldn't be hard to make something up yourself or fins a ready made one of the right size in RS.

As for fitting everything inot it I would be surprised if you could. The FC-30 isn't as big as you might think. By the time you put in all the relays, caps and inductors for a 100w ATU there will be little space for a PSU, even a switched mode version. Now if you were to run it from batteries thus limiting it at 20w you may get the ATU in plus some batteries (but not alot of capacity) or a small PSU but not all 3!

The internal batteries are charges seperate from the external 12v supply, and the charge ain't cheap!

25056. Re: [FT897] Cross band Operation

Yahoo group: FT897 (2009)
Date: 2009-02-20 13:20:10 UTC
From: Carl Wulfestieg
Topic: 25012 Message: 25056

Crossband Operation:
The "Crossband" capability must be built into the transceiver, such as the Icom IC-2710, which I have. For "Crossband" operation, you turn the "Crossband" feature "on". Now, when the transceiver receives a signal on one band, such as 2 Meter, it simultaneously transmits that same signal on the other band, such as 70 Centimeter. Obviously, when it receives a signal on the 70 Centimeter band, it simultaneously transmits that same signal on the 2 Meter band. While the "Crossband" feature is turned "on", the transceiver will not operate in its "normal" manner. To return to "normal" operation, the "Crossband" feature must be turned "off".

Split Band Operation:
Here, the transceiver is in "normal" operation. You manually transmit on one band at some frequency. Then, in most cases, you manually listen on the same band, but at a different frequency. The transceiver does not simultaneously transmit signals it receives.
"Split Band" operation began many years ago when separate transmitters (usually ham built) and receivers (many times purchased) were used. Transceivers had not been developed. At that time, before VFOs were available or built-in, transmitters were crystal controlled (you transmitted on a frequency determined by the crystal and could not change the frequency unless you physically changed the crystal).
Because of crystal control, you could not "zero beat" your transmitter to the frequency of the received signal. This meant that, after you transmitted, you had to "tune around" with your receiver, listening for a reply to your transmission. Once you found the signal, the QSO could continue without further re-tuning, except for drift, if any.

While, from a simple explanation, "Crossband" operation and "Split Band" operation may appear to be the same thing, they are not. Hope this helps to explain it.

We have a current run of the "Inspector Morse" detective series
running on a local TV channnel...
The ID music for the series is a nice piece of music
which is all sent as MORSE... it is a well known composition, but I cannot
remember the composer.....
Another useless fact :- Samule Morse, when he was inventing the code, it was for use as
telegraph,,,, with wires, before speech was implemented,,, he had a few versions,,, one
letter took a while to work out, and he dedicated it to his esteemed composer friend
"Beethoven, "
The letter in question was the equivelant of the roman numeral "5" represented by the
simbol
"V", ..._ from Beethovens 5th simphony ..._
This is the rhumour, true or not...
Keep working at the code,,, you'll be glad you did.

Selva -

As I know it, "Split" and "Cross Band" have two different meanings.

"Split" is a term usually used when transmitting on one frequency and receiving on a different frequency, but on the same band. An example would be if you transmit on 14.190 MHz and receive on 14.200 MHz.

"Cross Band" a term used when transmitting one band and receiving on another band. This is a common practice when working satellites where the "uplink" frequency would be on one band, while the "downlink" frequency would be on another band...Hence the term "cross band."

Not sure if the case part is available, but if you are looking for extra space you might want to consider making either a collar this extends the case down and gives you the extra room with the Fp30 below that, or making a 5 sided box to fit the bottom for the room. The FP-30 is not a flat extension and is actually taller on the front half than the back.

As far as the batteries they are in no way connected to the rear external 13.8v input. You need the special charger for them because the input needed to charge the battery packs is several volts above that.

>> Sorry folks....Cross band Ops and Split Ops seem the same to me, going by the explanations from Cliff and D F below !!! Pls elaborate.... <<

Maybe it will be easier to digest if it first becomes more complicated? Let's use three different terms, not just two: "split operations", "cross-band split operations", and "cross-band repeater". Don't use the term "cross-band" unless it is also clear whether you mean "cross-band SPLIT" or "cross-band REPEATER".

In "split operations", you the operator are using the radio with the microphone in your hand to talk to another person. But you are transmitting on frequency A and listening on frequency B. The other person is doing the reverse, transmitting on frequency B and listening on frequency A. This happens a lot in HF DX, especially in DXpeditions, in which the DX station will announce that she is "listening up 15", for example. So if you hear the DX on 14.180, you would transmit on 14.195 in order to be heard.

"Cross-band split operations" are a special case of split operations in which frequency A and frequency B are on different bands.

The FT-897 will do BOTH of the above operations.

But a "cross-band repeater" is a different animal altogether. In this setup, the transceiver to be used to "cross-band" in this way is set up in a good antenna position and configured to listen on a frequency on one band, in the US usually on the 70cm (440) band, and to simultaneously re-transmit what it hears on a second frequency on a different band, usually on the 2m band. This radio can have its microphone removed, because no one will be talking into it ... but a transceiver being used as a cross-band repeater often gets HOT due to the high duty cycle so it may not be wise to leave it unattended. To use this equipment, you must have a transceiver (usually handheld) that transmits and receives on different bands -- in effect, your transceiver must be able to do cross-band split operations in order to make use of a cross-band repeater.

The FT-897 CANNOT be configured to serve as a cross-band repeater. It can, however, be configured to make use of a cross-band repeater, by setting it up for cross-band split operations.

Though in practice what you say is usually true it is quite possible to operate in split mode across different bands, it is just not normally done. The real key here is to watch exactly what is said are you talking "Cross Band" or "Cross Band Repeat". The latter is a special feature of some radios (not the 897) that allows the radio to recieve on one frequency and retransmit that received signal on a different band. The Former ("Cross Band") really doesnt have a full meaning other that not on the same band.

To really muck it up you can have Split, Cross Band Split, Cross Band Repeat, or Repeater. The first two are the same with only the fact that you are using two different bands for RX/TX, the last two are the same with the exception of whether you are retransmitting on the different bands, or thesame band as recieved. The first pair you control the transmission (i.e. pressing the PTT button), the second set is automatic in radio once activated in that mode.

25065. Re: TX ERROR (60m)

Yahoo group: FT897 (2009)
Date: 2009-02-20 15:54:55 UTC
From: Steve Yates
Topic: 22093 Message: 25065

I concur with Dennis that you can only operate 60m through the preprogrammed 60m memory channels (later versions of the FT-897). However, IF you like quiet nationwide phone round tables where everyone is on about equal footing (power) then 60m is NOT a waste of time. Yes, because the frequencies are right in the middle of some government allocated spectrum they have put some tight requirements on us but it is better then no spectrum there.

Phone hams tend to channelize themselves anyway, just listen to 75m and you'll find a "channel" about every 3 kHz. I prefer CW most of the time but the way Yaesu setup the FT-897D it is easy to operate on 60m phone in the only legal manner. Yaesu probably had to do it that way before the FCC would approve the sale of the rigs in the US. Also, the way the FCC specified the channels by the center of the bandwidth rather then the carrier frequency it can be confusing to newcomers as to where they are really supposed to be. Yaesu made it easy.

Just for the record, I too would prefer a slice of spectrum on 60m rather the 'channels' but I'll take what we can get.

Not true. The local hams in my area commonly use a 70cm simplex
frequency on our HTs to cross-band repeat to our local 2m repeaters.
Most of the time we're cross-band repeating on Yaesu FT-8800Rs, but a
couple of the guys have Alincos.

To K5WLF.....
I read what you say, but it makes no sence to me..
I fail to see how your transmission on 70cms, can access
your local 2M repeater, and likewise can you explain (to everyone)
how your 70cms. HT can receive the 2 M talkback,
regardless of how many "cross band" FT8800R's are in the link.
The 8800R's are receiving on 70 cmc ??? from your HT.
How do they also receive the output of your local repeater ???
Here in little old Ireland, we have 2M, cross band "repeaters" linked to
70cms cross band repeaters... you need different ctcss tones to access either, depending
where you are (on the road, or up a mountain, or in a beautiful green valley)
You can even work "split" in on 70cms out on 2M or viceraversa.
You can even work conventionally, in and out on 2, or in and out on 70cms.
maybe there is another repeater somewhere on 220 Megs
[we have no 220 here]
Maybe I should buy one of those 70cms HP's you have over there.
What brand of HT is it ???
Keep 'spreading the message of emergency preparedness'.
Perhaps I will work you some time soon on 80M CW

I used to own an FT-8900, which is just like the 8800 except it also has 10 meters.. I traded it straight up for my FT-897D, because the former owner of the 897 wanted/needed its cross-band capabilities. The FT-8800 and FT-8900 CAN be configured for crossband operation. Those rigs can be configured to receive a signal on 70 cm and instantaneously re-transmit it on 2 meters, and when they receive a signal on 2 meters, instantaneously retransmit it on 70 cm. The 70 cm band on the 8800/8900 can be set up for simplex send-receive on some frequency other than is used by a 70 cm repeater, receive a signal from a 70 cm handitalkie, retransmit it to the 2 meter repeater, hear a reply on the 2 meter repeater, and retransmit it on the 70 cm simplex frequency, which the operator carrying the 70 cm handitalkie can hear.

It's a cool feature. I didn't use it with my 8900, but it allowed me to swap the 8900 for a much more valuable (in terms of price) 897D, the other ham thought the cross-band capability was valuable enough to him that he was willing to give up some $$ value.

25076. Re: [FT897] Re: Cross band Operation

Yahoo group: FT897 (2009)
Date: 2009-02-20 23:05:34 UTC
From: Larry D. Barr, K5WLF
Topic: 25012 Message: 25076

It's really pretty easy, Peter, so let's see if I can make the tellin' as easy as the doin'--

Think of the Yaesu FT-8800R as two transceivers in one box. Each of them capable of operation on either 2m or 70cm. Further, the radio has a built-in duplexer to enable one dual-band antenna to function for simultaneous transmit and receive operation.

To use the unit as a crossband repeater, you simply set up one side, say the left side, for the 2m repeater parameters you want -- frequency pair and tone options; and the other side with (in this case) the 70cm simplex frequency.

Then follow the directions on Page 56 of the manual to engage crossband repeat operation --

(From the manual)
Here is the procedure for setting up cross-band repeat operation:
1. Before enabling cross-band repeater operation, configure both band settings as desired, and set the squelch such that background noise is silenced.
2. Press the [SET] key momentarily to enter the Set mode.
3. Rotate the ?Main? band DIAL knob to select Menu #45 (X-RPT).
4. Press the ?Main? band DIAL knob momentarily, ?XSTART? will appear on the display.
5. Press the ?Main? band DIAL knob again to activate the cross-band repeater mode.
6. To exit the cross-band repeater mode, Press the [SET] key again.
</manual quote>

Hope that clarifies the process for you (and for everyone else), Peter. The HT I use for 70cm, BTW, is a Yaesu FT-60R, but any 70cm transceiver will do the job.

I'm gonna be in Co. Donegal this summer, Peter, so if you're up there, in a bar, and hear some ol' boy that sounds like he's from Texas, it might be me. Come over and say "Hi" and I'll buy you a pint.

True, as long as the others in the group (those with the HTs) either tune to the 2m frequency to listen and manually switch to the 70cm frequency to transmit ... or can hear each other on 70cm simplex. Of course, if you can ALL hear each other on simplex, why use a repeater? It's a good tactic if there's a small team in the field, all close to each other, but others listening in from a distance.

Let's not make this difficult, John. There's certainly no need to manually switch freqs on the HTs.

Some examples of how the technology is used:

A ham at a rest stop on a bike race, with an 8800 in his vehicle and a 70cm HT in his hand, is no longer tied to the vehicle for the duration of the race. Set the 8800 to X-band repeat and he's free to wander about the stop and still provide comms to and from net control via the 2m repeater. 70cm simplex to and from the HT to the pickup and 2m repeater pair freqs from the pickup to the local 2m repeater and thence to net control at the start/finish line (and vice versa).

Our monthly meetings are held in the Science Building at a local university. A 2m HT won't make the local 2m repeater for talk-in purposes, but a 70cm HT will hit an 8800 in the parking lot and get the job done just fine.

A couple of our local hams set up booths at craft fairs. An 8800 in the pickup and a 70cm HT at the booth. Good comms all day. No problem.

I can't understand why you'd say that the HTs have to be frequency switched. When you key down the HT on 70 cm simplex, the signal coming into the 70cm receiver of the 8800 keys the 2m xmtr in the 8800 which retransmits the incoming audio on the 2m local repeater input freq. Unkey the HT and the 8800's 2m side goes into receive on the 2m local repeater's output freq and retransmits received signals from the local 2m repeater on the 70cm simplex freq which the HT, being unkeyed, is now listening on. It's really very simple.

For the team in the field, close to each other scenario, we have a portable repeater on the "backyard" freq pair that we can use.

John KS6m is absulutelt right , FT897 can not be operate as cross band repeater, it has not capability,
if any one need to use this oprtion then he/she should have FT 8800R like me is using 8800R for my local repeater , i have linked it with our main repeater.

Hi Lew and John
Yes the procedure is easy explained when you know about the dual band TX - RX facility on the FT 8800 / 8900.
I was not aware of this,,, I had seen rigs with "dual watch", ie listen on both bands similtaneously
but cross band, dual band ,TX / RX, is the bit I had not met before.
Send me a post next time you are coming my way, Donegal is about 70 minutes drive from me (Co. Louth), I go there ofen with the XYL for weekend breaks...
You are just 3 years my junior, so I will buy you the pint of Guinness.
Best 73 from Ireland to ye all.

Hi Lew
You have cleared this queery up, I now understand how
the "Cross band / split " thing works...
The FT8800/8900 have ""Dual Band TX""" facility.
I have no experience of this before,
Many thanks for the information.
I guess we are never too old to learn.
It's 22.37 now...
I'm off for a lovely pint od Guinness or maybe 2.

Subject: Re: [FT897] Re: Cross band Operation

I used to own an FT-8900, which is just like the 8800 except it also has 10 meters.. I traded it straight up for my FT-897D, because the former owner of the 897 wanted/needed its cross-band capabilities.
The FT-8800 and FT-8900 CAN be configured for crossband operation. Those rigs can be configured to receive a signal on 70 cm and instantaneously re-transmit it on 2 meters, and when they receive a signal on 2 meters, instantaneously retransmit it on 70 cm. The 70 cm

band on the 8800/8900 can be set up for simplex send-receive on some frequency other than is used by a 70 cm repeater, receive a signal from a 70 cm handitalkie, retransmit it to the 2 meter repeater, hear a reply on the 2 meter repeater, and retransmit it on the 70 cm simplex frequency, which the operator carrying the 70 cm handitalkie can hear.

It's a cool feature. I didn't use it with my 8900, but it allowed me to swap the 8900 for a much more valuable (in terms of price) 897D, the other ham thought the cross-band capability was valuable enough to him that he was willing to give up some $$ value.

25099. Re: MD-100 A8x Mic

Yahoo group: FT897 (2009)
Date: 2009-02-21 11:06:24 UTC
From: kbrown1075
Topic: 25037 Message: 25099

I have the MD-100 on my 897D and found it to be a bit of a dissapointment. If all you want to use it for is a mic, then it will work, however if you want the ability to scan and change freq with the control on the base then you may want to think about it. I have found that to bump freq up or down in a fine adjustment it will work, but if you hold the control, for example "down" position" it will shut the radio off. Holding it in the up position will cause it to go into vfo up scan. I find myself still using the MH-31 mic that came with the 897 more than the MD-100.

Good luck with your choice,

Kirk

Topic: 25033 Message: 25101

Gavin and George:

Well, it's good to know that Yaesu has a parts dept. that is easy to work with...

I'm thinking that it would be a tight fit, but I was looking at fitting batteries in the original battery compartment, (I've seen two files on here of home-brew battery installations). Then seeing if a 20W (like the one from LDG) wide range tuner and a small switcher would fit in the empty FP-30 space. I have a Toughbook computer from work, it has a nice little 15.6V @ 5A supply. That should be enough to run the radio at 20 W output, and properly charge some NiMh batteries I think.. The case to that supply measures 5 3/8 X 2 X 1 inches.. I'm sure the supply itself is quite a bit smaller, but my employer wouldn't like me cracking open the sealed case just to see what's inside..

I'd like to get to a self-contained radio with power, battery, and tuner.. The electronics isn't so hard, it's getting a case that is rugged and looks professional that's the trick..
I've even thought of trying to find an empty case for a military radio like a PRC-77 or PRC-25 to try and mount all this into..

First purchase is going to be the radio of course.. I'm leaning towards the Yaesu as oppossed to the Icom, in reading the posts on the various groups, it seems that there is a lower percentage of posts talking about Yaesu failures compared to Icom failures..

Anyway, thanks for the input guys,
Bill - AB9TA

Some of the website show installing a 12 volt battery, but you need a 13.2 volt battery. I found one at this site for $70, with a charger and cables. You can either use it like it is out take it apart and reassemble it so it fits inside the radio. You will have to come up with the connector for the radio internal battery or just solder to them, or get some molex pins and make one.

25110. FT jumper mods

Yahoo group: FT897 (2009)
Date: 2009-02-23 03:21:34 UTC
From: j_old_man
Topic: 25110 Message: 25110

I was thinking of doing the some of the jumper mods on my rig but if the mods opens it up for cb then the mods aren't legal. Is that the way it sounds. or is there some jumper mods that are ok to make. I was wanting to open the 70cm up so I could use the 420 mhz to 430 mhz which is now a tx error. So would this be a legal mod or not.

I hope i haven't reopen a bad subject.

Thanks

Jerry - wb9onu

25112. Re: [FT897] FT jumper mods

Yahoo group: FT897 (2009)
Date: 2009-02-23 04:36:12 UTC
From: Randy Charles Ford
Topic: 25110 Message: 25112

I suggest that you review the FCC rules so you know for sure. I, or others, could be wrong, and you are responsible for what happens even if you get incorrect advice.

However, as I understand it, there is no limitation placed upon hams concerning what their built or modified rigs can do. Manufactures must meet different rules, so thy are limited in what they can sell. However, we are not limited in how we modify them for our personal use. We are, of course, individually responsible for how we use them.

For instance, while there is no FCC rule of which I am aware to prevent me from modifying my rig to transmit on CB bands, there are rules that prevent me from actually transmitting on them over the air, unless it is an emergency that meets the FCC requirements.

For instance, consider traveling down the road while listening to a CB, and hearing a distress call from somebody injured and trapped in a wrecked car where nobody could see them, and there was no indication that anybody else could communicate with them. If, after failing to raise them on the CB, you switched to 100W on your ham rig and could communicate with them, you would probably be meeting the FCC rules in doing so.

Another instance happened with a firefighter who transmitted on his fire departments frequency using a modified HT. He considered the transmission OK, because of his definition of an emergency; however, his department did not. They report the instance to the FCC, who took action against him. His having modified his HT for the expressed purpose of using it on the departments frequency was taken to show intent to violate the rules. It appeared that his goal was to be able to only carry one HT. If he had never transmitted, he would not have broken the rules.

I have read that an unmodified FT-897 may transmit out of the ham bands, at least on the edges of the allowed frequencies. They can transmit using modes or powers that are not permitted on ham frequencies. No matter what the rig can do, the operator is responsible for what it does. That doesn't change based on mods.

Now, even though it may be permitted to open up the radio, is it a good idea? What is the likelyhood most hams would ever have an opportunity to legally use the rig out of the ham bands? I'm sure that there are some who are in environments where it is more likely, but most probably aren't. What is the likelyhood of somebody unauthorized using the rig. If they used it on public safety or air bands, the result could be far worse than if they misused it on ham bands.

Before opening one up, I suggest that each ham carefully consider their motivations. If you want to use it for non-ham purposes, you should consider

alternatives. For most hams, opening them up is likely not a good idea, but only the individual can decide why they want to do it, and if it is really appropriate for them.

73,
kg4jix randy.

The mod itself is not illegal. It is WHAT YOU DO with the rig afterwards that MAY get you into trouble. I have my 857 opened for 2m 440 for a few reasons, one because I need access to some of the 460 and 150 MHz areas for work and instead of having several radios in the car, I have only one.

However, if you use the rig, say, in the 11m portion knowing the power limitations per the FCC AND given the fact most non-radio understanding people who may suffer interference just may complain, you are asking for trouble.

If you have a legitimate use for the mod and have proper documentation, licensing, etc., you have nothing to worry about.

But, as has been stated, 11m band operation with this radio MAY get you unwanted attention, headaches and loss of funds that, right now, I doubt anyone would want.

Yahoo groups are having technical issues. Some people are getting spammed with multiple copies of emails; there's nothing the mods can do except wait with the rest of us. Performance got so bad on our club's yahoo group that I had to move it to google groups.

Sorry, but unless the "Entity" for which you work happens to be the Federal Communications Commission, and/or the F.C.C. has granted a waiver of regulations, in writing, you are very likely in violation or F.C.C. rules, which specifically REQUIRE usage of approved/certificated equipment ONLY for use on your job network. You could, potentially, cause big problems for both yourself AND your employer, including loss of your license and your job! (Among other things, I am a former F.C.C. employee, being assigned as a license examiner at F.C.C. headquarters, on 1919 M street, Washington, D.C. in 1974.) -In your position, it seems foolish to take chances! Commercial/business, Police, Fire, Aviation, Marine, Broadcast, and local government radio licensees DO NOT have authority to waive F.C.C. regulations! If you sill have doubts, why not WRITE the F.C.C., give them all details, and specifically ASK for written affirmation or denial to utilize the modified FT-897 in your business duties as described? IF they affirm your ability to do so, THEN you would be on solid ground to continue. (I would NOT advise continuing without written permission/waiver of F.C.C.rules from QUALIFIED U.S. government entity.)-You could also ask my friend, a F.C.C. former attorney, James Talens, N3JT- his phone is 703-241-1144--------Be careful, be legal!-73, KC3VO-Bob Curry

From: D F
Topic: 25128 Message: 25129

If you hold the paper in your hand stating you passed, you may use the portions of the band for extra right away, you need to append your call with "/AE" such as N8BMB/AE.

Congrats!

Dennis - N8BMB

Wayne,

You can use your privileges right away (you earned them!).

When you do go into the Extra frequencies, be sure to identify your call sign with "Temporary Extra" if using phone... that way, someone doesn't yell at you if they look you up and see you listed as General.

-Shane
KV3SPA (failed my Extra test on Friday).

I hope you tried it twice. You have never really failed until you take the test two times on the same day. Remeber, what you didn't pass think about it because your sure to have a question like it on the next test. I failed the test by one question the first time and passed it by one extra the next time. The VEs encouraged me, and I will be for ever thankful.

Congrats -

Yes, you can immediately use your privileges. However, you must affix a /E
to your call when operating outside of the bands your current General Class
ticket entitles you to utilize.

When operating on the Advanced and Extra Sections, you will use the call
W5YNE/E until the notice of your upgrade appears on the FCC Website.

Again...Congratulations,

73,
Jay/AF2C

KV3SPA,
although i do have a full English Licence i did take the Exams
here in USA too to save me having to put a W%/ in-front of my call,

Dont give up, i used QRZ/ e-ham and another practice test on the w5ddl
site, the last one gives yor score for each of the sub sections such as
e6 etc etc,

I took the test each day for two weeks until i was avergaing at 90%,
some times i'd get the first 4 questions wrong BUT i still continued
with that one and passed,

Good luck mate and thanks for the Advice

M1EVK
W5YNE
Wayne

Thanks to all for their comments and help

25136. RE: [FT897] Re: General Question about the Extra licence

Yahoo group: FT897 (2009)
Date: 2009-02-23 22:39:00 UTC
From: Bruce Krell
Topic: 25128 Message: 25136

Shane,

Don't be intimidated and don't give up.

The Amateur Extra exam requires a wide range of knowledge about a wide range of topics including transistor electronocs. computer engineering, GPS, Radar, Ship and Aircraft
radios, and even vacuum tubes -- large commercial stations use them so you still
need to know about them.

Frankly, having an EE degree and even some experience is only a minor advantage
in taking the exam. The technical topics are so broad that the EE degree really
doesn't give you that much advantage.

For instance, I'm a sofware geek, but I built software for a lot of the systems
that you have to know, taught computer engineering, and had a lot of practical
hands-on experience. That is the background that really helps. If you've done
a lot of radio building and operating, you are also much better prepared.

Here are some suggestions:
learn to sight recognize the right answer to the question
don't bother studying the wrong answers -- the distractors -- they
will only waste your time and energy
pick a term in the question and some corresponding term in the answer
that lets you quickly sight recognize the answer.
study the whole question pool.

While the practice exams are OK, if you are not studying the question pool
and the right answers, it will really take you a long time.

Bruce Krell

If you are in the States, you can use your existing call but adding /AE to it eg W5YNE/AE meaning 'acting extra', when you walk out of the exam room with the piece of paper in your pocket. If you are currently resident in the UK, and you went to France, you couldn't call F/W5YNE until you actually had received the license. Hope that all makes sense.

Congratulations.

Agreed.

I have this "thing" about actually knowing the material, so failing
the test gave me a better idea of what I need to work on.

Thank you all for the encouragement.

I'm also learning code at the moment, so I have plenty to keep me busy.

Take care,

Shane

25141. Splitting the data jack...

Yahoo group: FT897 (2009)
Date: 2009-02-24 00:17:21 UTC
From: Shane J. Wolfe
Topic: 25141 Message: 25141

All

I have an 897D. I currently use an audio interface and a TNC via the data port on the back. I'd like to find a splitter so that I can use them without unhooking cables all of the time.

Has anyone where successfully used a "PS2" Y cable to split out the data jack? I don't want to use devices at the same time... I just want to "switch" between them without messing with the cables.

How soon can you take it if you fail the first time?

It all depends on the VE running the exam session.

In this area, if you get close, they will generally let you take it again right away. If you fail again, you can take it again at the next exam session.

FCC and ARRL guidelines say you can take it as often as you like, but...if you are retaking it after a fail, you **MUST** pay the $15.00 fee again, each 'retake'.

That gets confusing to some VE's, as it is also correct to say, if you come down and, say, (As happened last Saturday!) a fellow took his Tech, then his General, and then his Extra...passed them all...it only cost him the first $15.00.

Mr. Wolf was correct on all points. You have to pay to take another test and if you are close I would certainly ask to take it over. The rules are that you can keep taking it over as long as you pay. If you pass one test you can take the next for free. If you found another group testing next week you could take it then. There is no waiting period. Waiting a couple of months can be really tough.

I think when I got my Novice and Advanced, if you missed it, you had to wait a month to take it over again. I never had general, went from Novice to Advanced, but it took a couple of times to get the 13 wpm code test. Back then the only difference between the Advanced and Extra exam was the 20 wpm code test. The written part was the same, so I don't understand why they didn't make the advanced an extra when they eliminated some of the license classes and grandfathered others. I've taken several of the on line tests, and the scores have been between 81 to 90 %. What is the percent I need to get on the real test?

From: Eric van de Weyer
Topic: 25141 Message: 25149

Hi Shane,

A computer keyboard/mouse splitter is unlikely to work as the two devices use different pins.

Why don't you just make yourself up a little switch box to toggle between the two different cables? I have often doe this sort of thing when I want to use, say, two different mics into the mic input or similar.

73....Eric VK2VE.

25151. Hum during TX in FM mode

Yahoo group: FT897 (2009)
Date: 2009-02-23 11:57:44 UTC
From: rainbow_radio_league
Topic: 25151 Message: 25151

There is a continuous hum, not very loud, while TX in the FM mode. The equipment is properly grounded to an independent earth. We have tried isolating all other devices in the QTH including lights and even the fridge, but the hum still persists.

I am wondering if it could be the internal cooling fans that is causing the hum. If that could be the problem , how can the hum be removed ?

Your assistance is appreciated.

Don J88CD

Here are the corrected suggestions:

1) learn to sight recognize the right answer to the question
2) sometimes the wrong answer choices give away the correct answer
3) pick a term or (combination of words or letters) in the question and some corresponding term (or combination of words or letters) in the answer that lets you quickly sight recognize the answer.
4) study the whole question pool everday. Concentrate on the questions that you regularly miss and think of a creative way to remember the answer.
5) Be confident in your ability and walk right into the exam room and own the room and the exam.

Do the above, and you too can get all of the answers correct in the Technician, General, and Extra Class examinations.

Believe it...or believe it.

Subject: RE: [FT897] Re: General Question about the Extra licence

Shane,

Don't be intimidated and don't give up.

The Amateur Extra exam requires a wide range of knowledge about a wide
range of topics including transistor electronocs. computer engineering, GPS,
Radar, Ship and Aircraft
radios, and even vacuum tubes -- large commercial stations use them so you
still
need to know about them.

Frankly, having an EE degree and even some experience is only a minor
advantage
in taking the exam. The technical topics are so broad that the EE degree
really
doesn't give you that much advantage.

For instance, I'm a sofware geek, but I built software for a lot of the
systems
that you have to know, taught computer engineering, and had a lot of
practical
hands-on experience. That is the background that really helps. If you've
done
a lot of radio building and operating, you are also much better prepared.

Here are some suggestions:
learn to sight recognize the right answer to the question
don't bother studying the wrong answers -- the distractors -- they
will only waste your time and energy
pick a term in the question and some corresponding term in the answer
that lets you quickly sight recognize the answer.
study the whole question pool.

While the practice exams are OK, if you are not studying the question pool
and the right answers, it will really take you a long time.

I missed it by a long shot this time around, so they wouldn't let me take
it a 2nd time.

Not giving up by any means. I don't feel so bad though because an
electrical engineer failed it by just as many questions as me.

I'll keep trying!

25153. My rig plans

Yahoo group: FT897 (2009)
Date: 2009-02-23 17:20:04 UTC
From: fxrcurt
Topic: 25153 Message: 25153

Hi all,

Name's Curtis, N5FXR. I've been a Tech since Feb'04 and have been totally enjoying my mobile and hand held radios mostly on 2m repeaters. I've joined the local ham(repeater)club and have been making ham friends in my new town of Harrison, Arkansas. Close to the center of the USA. I'm pretty darn close to sending my first CW CQ and I intend on becoming fully proficient in morse code.

Well, it's time to get my first HF rig and move my current base rig(a Yeasu FT-7800R mobile)into our other vehicle. So as you can expect, I'm going to still need at least some VHF 2m capabilities and would like UHF since there are more and more 430 repeaters going up all around. Offerings in a DC to Daylight rig for my price range look like they include the IC-706kIIG, IC-7000, Kenwood TS-2000 or the three Yeasus that do HF thru 70cm. You know I live in tornado, ice storm and general bad weather land so the option of also having a "grab and go" emergency rig would probably be a good idea.
I have made my mind up and changed it several times trying to make a decision. I don't mind Yaesus. I always want more and the FT-450 and FT-950 have been creeping into first place because of the HF bells and whistles but I seem to default back to the FT-897D for its versatility.
One more thing and I'll stop. I'm studying for my General and will eventually make Extra class(knock knock). I will be getting a good paddle and keyer and plan on spending a LOT of time on CW.
So..... I'm trying to cover a lot of bases here and wanted to ask "Does it sound like the FT-897D is the "best choice" first HF radio given my circumstances?"
Thanks,
Curtis

Is your power supply clean enough? Large enough?

Try turning your power down as low as possible and test it simplex and not through a repeater.

Put an AC volt meter on you DC output of your supply. Should be < .1v but really should be nothing.

It is possible that the "HUM" is normal, if the subaudible, or "PL" TONE is engaged. ("TEN" is ON)--This enables transmitting a low-level tone, of selectable frequency, during transmit, to operate a corresponding tone detection circuit in a receiver. These tones normally are between 60 and 300 HZ.-73, KC3VO, Bob C.

Subject: [FT897] Hum during TX in FM mode

There is a continuous hum, not very loud, while TX in the FM mode.
The equipment is properly grounded to an independent earth. We have
tried isolating all other devices in the QTH including lights and even
the fridge, but the hum still persists.

I am wondering if it could be the internal cooling fans that is
causing the hum. If that could be the problem , how can the hum be
removed ?

Your assistance is appreciated.

Don J88CD

Thanks, Wayne. The lowest I've scored on the on line tests is 80%.
I've been able to do most of the math in my head by remembering from
school days that one of the right triangles sides just happens to be
called a 3, 4, 5 right triangle, where the sides of the triangle are 3,
4 and 5, because 3 x 3 , plus 4 x4 = 25, so the hypotenuse must be the
sqrt of 25 which is 5. I've used that formula to build temporary a
temporary square in the past. And those numbers seem to come up on
tests every so often.

It could be a ground loop of some kind. Go to an unused frequency, get another radio with headphones, xmit and do a wire-wiggle check. Check all connections. Most likely the one that cuts in and out while you wiggle it, is the one with the problem.

Subject: [FT897] My rig plans

Hi all,

Name's Curtis, N5FXR. I've been a Tech since Feb'04 and have been totally enjoying my mobile and hand held radios mostly on 2m repeaters. I've joined the local ham(repeater) club and have been making ham friends in my new town of Harrison, Arkansas. Close to the center of the USA. I'm pretty darn close to sending my first CW CQ and I intend on becoming fully proficient in morse code.

Well, it's time to get my first HF rig and move my current base rig(a Yeasu FT-7800R mobile)into our other vehicle. So as you can expect, I'm going to still need at least some VHF 2m capabilities and would like UHF since there are more and more 430 repeaters going up all around. Offerings in a DC to Daylight rig for my price range look like they include the IC-706kIIG, IC-7000, Kenwood TS-2000 or the three Yeasus that do HF thru 70cm. You know I live in tornado, ice storm and general bad weather land so the option of also having a "grab and go" emergency rig would probably be a good idea.
I have made my mind up and changed it several times trying to make a decision. I don't mind Yaesus. I always want more and the FT-450 and FT-950 have been creeping into first place because of the HF bells and whistles but I seem to default back to the FT-897D for its versatility.
One more thing and I'll stop. I'm studying for my General and will eventually make Extra class(knock knock). I will be getting a good paddle and keyer and plan on spending a LOT of time on CW.
So..... I'm trying to cover a lot of bases here and wanted to ask "Does it sound like the FT-897D is the "best choice" first HF radio given my circumstances? "
Thanks,
Curtis

A physical test where you start by moving the case gently and then a bit more vigorously. You listen to detect any broken signals or other changes, intermittencies etc. Subsequently you try 'waggling' individual wires to see if any of them produce these effects. You would also try pushing all connectors home and where appropriate, rotate them in their housings. etc etc Basically you are looking for any mechanical weaknesses or instabilities.

25170. Fwd: [FT897] TX Hum in FM mode(Check "TEN",Tone Encode)

Yahoo group: FT897 (2009)
Date: 2009-02-24 20:10:09 UTC
From: kc3vo@aol.com
Topic: 25157 Message: 25170

Have you yet made the check, to see if the "Subaudible Tone" -is off?
This low frequency tone is user selectable, for frequency and useage.
(Normally it is only selected if you desire to open the "Tone Squelch"
on a distant receiver/repeater. If activated, it does impart a
low-level "HUM" to the transmitted signal, and ONLY IN F.M. MODE-your
situation!-- Have you determined the frequency of your mysterious HUM?
Does it change volume or pitch?-73, KC3VO

-----Original Message-----
From: KC3VO@...
To: FT897@yahoogroups.com
Sent: Tue, 24 Feb 2009 4:02 am
Subject: Re: [FT897] Hum during TX in FM mode(Check "TEN")

It is possible that the "HUM" is normal, if the subaudible, or "PL"
 TONE is engaged. ("TEN" is ON)--This enables transmitting a low-level
tone, of selectable frequency, during transmit, to operate a
corresponding tone detection circuit in a receiver. These tones
normally are between 60 and 300 HZ.-73, KC3VO, Bob C.

Topic: 25151 Message: 25171

Hi Don,

it is most likely that you have CTCSS switched on. This will show as either
TEN (Tone ENcode) or TSQ (Tone SQuelch) on the display. If you don't need
the CTCSS, switch it off. If you do, then learn to put up with it. By default,
the tone will be the lowest frequency one which is 67Hz.

We have it here in Sydney on our local repeaters using 123Hz.

73....Eric VK2VE.

I went portable this weekend with one of my FT-897D's, FNB-78s and the Buddistick. Outstanding combo, and I will never look back. I have 2 FT-897D's I use in the base role, but have added the batteries and soon the power supply. I can take either of the bases portable and go anywhere.

Personally, I can afford to purchase any radio I want, and while the others listed are great and have different features, I wanted multiple moble radios, that could take the batteries and addition accessories, but could also work the base role. Plus, I plan on taking one FT-897D portable with me for my next tour in Iraq. That was the selling point, portable, portable accessories, rugged, ...period.

Hi Jim,
And thanks. I guess i have it narrowed down to 160 thru 70cm but the grab and go idea (mainly portable battery option) may be keeping from some slightly nicer HF radios. I'm so close to buying the 897D but if you could do it again, would you opt for say the IC-7000, MkIIG, or even Kenwood TS-2000 given what you know now?
Thanks for responding.
Curtis

Subject: [FT897] My rig plans

Hi all,

Name's Curtis, N5FXR. I've been a Tech since Feb'04 and have been totally enjoying my mobile and hand held radios mostly on 2m repeaters. I've joined the local ham(repeater) club and have been making ham friends in my new town of Harrison, Arkansas. Close to the center of the USA. I'm pretty darn close to sending my first CW CQ and I intend on becoming fully proficient in morse code.

Well, it's time to get my first HF rig and move my current base rig(a Yeasu FT-7800R mobile)into our other vehicle. So as you can expect, I'm going to still need at least some VHF 2m capabilities and would like UHF since there are more and more 430 repeaters going up all around. Offerings in a DC to Daylight rig for my price range look like they include the IC-706kIIG, IC-7000, Kenwood TS-2000 or the three Yeasus that do HF thru 70cm. You know I live in tornado, ice storm and general bad weather land so the option of also having a "grab and go" emergency rig would probably be a good idea.
I have made my mind up and changed it several times trying to make a decision. I don't mind Yaesus. I always want more and the FT-450 and FT-950 have been creeping into first place because of the HF bells and whistles but I seem to default back to the FT-897D for its versatility.
One more thing and I'll stop. I'm studying for my General and will eventually make Extra class(knock knock). I will be getting a good paddle and keyer and plan on spending a LOT of time on CW.
So..... I'm trying to cover a lot of bases here and wanted to ask "Does it sound like the FT-897D is the "best choice" first HF radio given my circumstances? "
Thanks,
Curtis

From: Ruben Navarrete Galvan
Topic: 25153 Message: 25174

I do have an FT857D for my Jeep and FT897D (w/AT897 tuner) for my shack. I frequently take my 897D on trips and power it from different sources:

- Internal PSU in my shack (works great)
- 12volt, 7amph battery, works great under 30 watts for portable setup.
- Connected to a small portable generator from kawazaky (only 550VA) with the internal PSU under 40 watts. This works great for several hours. I have tried this from the 12 volt outlet from my generator but doesn't work that well.

Great radio... I have used both radios it in harsh environments (humidity, dust, shocks) and they keep working great !!.

Are you running tone on transmit? Even though it is supposed to be
subaudible, the lower tone frequencies like 100.0 and 88.3 can sound
like AC main hum. That would explain why it only happens on FM.

You need to think about how you are going to use the rig. It is a very nice portable unit, however, there are 80 some odd menu options that you need to change while you are operating and a small screen. So, for a main rig, something with more buttons and less menus might not be a bad idea. I ended up with an FT 897D for a back up/portable unit and an ICOM IC 756PRO for the main rig. There is a big difference in listening pleasure between the two.

Hey Buck,

Glad to hear the batteries are working for you and you're giving them some exercise.

You mentioned getting the internal supply for the 897. If you want to get the FP-30, Gigaparts has them for $189.00 if you order while they are out of stock.

25180. Re: My rig plans

Yahoo group: FT897 (2009)
Date: 2009-02-24 13:15:20 UTC
From: Hank
Topic: 25153 Message: 25180

Hi Curtis. My name is Hank, KB4MTO, and I am also new to this group. I live in Orlando Florida, so I was looking for an HF rig that will take me from 160m - 70cm, will be easy to operate in an emergency, and kept coming back to the 897 for a few reasons. It has 100 watts out on HF in a small package and offers the built-in 120 VAC power supply. I like that so that I do not have to have a seperate PS on/ under my desk. It supports CW/data/voice, and can be computer controlled. But the deciding factor was the built-in battery pack option. Here in Orlando, we always have hurricanes looking our way. Should the next hurricane take power away, I can remove the built-in PS and replace it with 2 built-in battery packs. That along with the LDG AT-897 tuner (which I recommend over the Yaesu FC-30), I can be up without the need for a generator.

I have had the rig for a week now, and I love it. I have the LDG AT-897 and the MFJ-1622 apartment antenna, and it is doing great. I will be setting it up for psk31 this weekend, and hopefully will have a dipole in the attic within a few weeks (deed restricted townhome). I am very happy with this rig.

hth,

73 de KB4MTO

From: alphaindia4oscartango
Topic: 25181 Message: 25181

we were talking about this on the 2m repeater this morning ... lots of good ideas have been suggested ... my two cents is this (i'm not conntect to this business in anyway) "Gordon West" his audio cd and book are excellent. listen to the cds while reading the book at the same time ... do that a few times and remember the test taking tips he has and you'll pass! i was first licensed in 1968 and tube theory was still in vogue ... however, i was able to learn because of an understanding of the basic physics and rf theory i learned way back then. being a youngster in 1968 made understanding the application of the theory more difficult because i had not seen much of the theory put into practice. now, having seen lots of the theory put into practice, gordon west explaind the theory and i was able to pass on the first try (doing ham tests online confirmed that i learned the theory) ... my test taking tip is to read the questions and possible answers VERY CAREFULLY ... good luck ... 73 de charles ai4ot

25182. wiring RIGblaster m8 for Yaesu FT-897

Yahoo group: FT897 (2009)
Date: 2009-02-25 01:54:28 UTC
From: kd8dhh
Topic: 25182 Message: 25182

I recently purchased a used Rigblaster M8 on E-Bay. It did not come with any cables or manuals. I had several Yaesu hand-mics with a cable with rj45 connections on both ends. I was hopeing that it was wired correctly to use with the Rigblaster. The second problem is, I can't find a diagram showing the jumper wire settings for the FT-897. I went to their site and tried the one for newer Yaesu radios but, evidently the 897 is wired differently. Any help would be appreciated.

Thanks, Tom de KD8DHH

Actually the fees are set by the VEC group. The FCC only sets the maximum allowed fee. Our VEC group (Laurel) does not charge a fee for any testing. Retests are up to the discretion of the VE in charge of the test session. Our particular group typically allows a retest if we think the examinee has a good chance of passing the retest (ie - missed only one or two more than allowed to pass.) The ARRL sets fees only for the ARRL VEC, not for the other VECs...

Harold,
As you know, there are plentyof study guides out. Most of them will take you through the math or at least give you some good clues on how to "gut" through the answers. Over all the math isn't all that hard, and a good calculator to do the math isn't that expensive at the various office supply houses.

Good luck, I'm keep getting 80's on my on-line tests, so I'll probably test for my Extra at the next session next month.

Cheers,
John

From: Curtis Popke
Topic: 25153 Message: 25185

Does the internal power supply FP-30 cause any hum, buzz or interference
in the radio or is it completely audibly (<-is that a word?) invisible?

Thanks Jim,
You know a forum can be a great psychologist to really help you think. I don't
want to just do what someone says but use what they say and make my own decision.
Well I think I've made it. Being new to HF and having all the magazines I naturally want
the biggest, prettiest most awesome rig I see. But right now that's putting the cart in
front of the horse.
I'm gonna get that FT-897D first. This way I will be more likely to add a say Cadillac
later and have
both a nice portable, grab and go setup AND a nicer base setup to enjoy in the future.
 If I were to get a larger base unit first I might not ever pickup the 897D.
So Jim you said it right "big difference in listening pleasure" but I have to put function
and
need before pleasure. 756PRO or similar will have to come later but that's ok as long as I
eventually
end up with both rigs hi hi. Hope the xyl doesn't read this.

>You need to think about how you are going to use the rig. It is a very
>nice portable unit, however, there are 80 some odd menu options that you

Hi folks
Does the mars mod affect the rig other than open the band width tx wise?
I have a 7800 in the car that's opened up and the 70cm repeater split was altered to the US one!

Just curious that's all

From: Jochen - DG2IAQ
Topic: 25151 Message: 25188

Hi Don.

Maybe you could have a look at www.mods.dk into the YAESU/FT-857 or YAESU/FT-897 chapter (if I remember correctly it should be in the 897 chapter):

There's a mod of an italian OM, called "Massimo", and he soldered a jumper wire in between the DSP ground and the common ground on the downside of the MAIN PCB.

I had the same problem with my FT-897D. The FM humm might be heard very low, but on SSB it's like sitting in a train with open windows.

vy 73,
Jochen (DG2IAQ)

25190. FT897 Weak Audio Questions

Yahoo group: FT897 (2009)
Date: 2009-02-25 16:18:20 UTC
From: Niel Skousen
Topic: 25153 Message: 25190

I'm having some problems with an 897 I sold to a friend, and wondering if anyone has seen this before ?

Abruptly several weeks ago the audio level dropped on the 897. The receive performance seems to be ok, but the maximum audio out (speaker and phones) is down by a factor of 6~8 (by ear, 10 dB or more). There is no visual damage to the Audio PA chip, and it seems to be contributing an appropriate amount of gain...

Anybody seen this before ? Any extended / tech menu settings that may apply ?

Also, this is a non-D radio, if my friend sends it back to Yaesu for repair, is it worth asking for a firmware upgrade ??

Hey Buck,

Glad to hear the batteries are working for you and you're giving
them some exercise.

You mentioned getting the internal supply for the 897. If you want
to get the FP-30, Gigaparts has them for $189.00 if you order while
they are out of stock.

> I went portable this weekend with one of my FT-897D's, FNB-78s and
the Buddistick. Outstanding combo, and I will never look back. I
have 2 FT-897D's I use in the base role, but have added the
batteries and soon the power supply. I can take either of the bases
portable and go anywhere.
>
> Personally, I can afford to purchase any radio I want, and while
the others listed are great and have different features, I
wanted multiple moble radios, that could take the batteries and
addition accessories, but could also work the base role. Plus, I
plan on taking one FT-897D portable with me for my next tour in
Iraq. That was the selling point, portable, portable accessories,
rugged, ...period.

25194. MFJ-1278 TNC Connections

Yahoo group: FT897 (2009)
Date: 2009-02-26 00:09:52 UTC
From: j13rt
Topic: 25194 Message: 25194

Just pulled an old MFJ-1278 TNC from my amateur radio storage box. I know I have to update the firmware from ver 2.2 to the current 3.7 (MFJ-48). The question I have is related to the connection between the 6 pin miniDin Data Port on the 897D and the 5 pin Din on the TNC Radio port.

The TNC support one rx audio/data (in) connection. The 897D provides separate 1200 and 9600 rx data (in) connections. Can I tie the 1200/9600 connections together with the TNC rx (in) or do I have to build a switch box to toggle 1200/or 9600 to the TNC...

any suggestions???

Also, the MFT-48 docs suggest getting a new owners manual, 5th. edition if your current ver is 3.3 or earlier. This manual is no where to be found on the MFJ website. Does anyone know if there is a .pdf version online or a source for the paper version?

tnx,

Jim

Harold,
I can certainly understand and identify with your situation! Like yourself , due to circumstances beyond my control, my "high school" education was somewhat less than optimal. I too have had to obtain and develop any of the more complex math skills through self education and dogged determination...but boy oh boy it hasn't been easy! So, as a former President once said, "I feel your pain"!
Like yourself Harold, I too am studying for the Extra class exam. For what its worth I find that the exam preparation materials published by the "Gordon West" group seem to be the best way (for me anyway) to help not just to learn the correct answers to the question pool BUT, more importantly, to understand the "whys and wherefores" that lie beneath the theory and help me understand some of the more complex electronic and mathematical concepts surrounding our hobby. I'm sure there are other grear ways to prepare for this exam but, well, this series seems to work best for me. There are lots of great materials out there!
I guess that you and I have been presented somewhat of a second chance to learn and to more fully appreciate some of the more complex and challenging subjects and theories that we missed out on during our "younger" days! :)
Best of luck to you Harold!
See you at the top (Extra Class) !
'73!

When you take an on line test, it is a good idea to google the question and answer so you understand it, rather than just try to memorize the answers.

Hi Jim,

I have not noticed any hum, hash or anything else with the FP-30 installed. However this is based on my personal experience and others my have experienced something different.

This power supply itself is identified by its attached label as FP-30B which is as I understand the improved version of the original FP-30. The unit was purchased a week ago tomorrow at the Orlando hamfest.

I sent my 8987D to Yaesu to have the CAT port repaired. They called Tuesday evening to say the repairs would be about $80. So hopefully, I will get it back in the next few days.

I have been running the FP-30 for about 2 weeks now and I have not noticed any hum either, and that is even with the rig ungrounded.

25201. Re: [FT897] Re: General Question about the Extra licence

Yahoo group: FT897 (2009)
Date: 2009-02-26 19:33:33 UTC
From: af6cm_yahoo@myfastmail.com
Topic: 25128 Message: 25201

I have never been a fan of (or good at) simple memorization. I much
prefer to understand the material. The information that one learns
for the license is useful - so it is best to understand it. If you
don't understand it, it won't be very useful to you.

When I was studying for my Extra, I initially used the Gordon
West book. His books had worked well for me for the Tech and General
licenses.

Unfortunately I found that his Extra book was sometimes lacking in the
explanation department. Some answers essentially said to memorize.
That's not what I want! So, I bought the ARRL book and found that
it did explain things fairly well. I even got the impression that
the questions and the ARRL book came from the same source.

No, you operate on MARS bands with a MARS license. The requirement
to obtain a MARS license is a valid amateur radio license (I think
technician class or better, but I could be mistaken on that).

From KD5LBE and the MARS Web site. I will look into the MARS suystem more.

1.A General Class Amateur Radio License will be a requirement for MARS members. Technician Class licensees will have a period of one year to upgrade to General Class.

The answer to your question yes.

The MARS frequencies do not actually fall under the FCC's domain. It is to
best of my knowledge under the DoD.

True, but the explanations of the answers are what differentiate
the books. The questions and answers are from a pool that the VEC
uses to create the actual test for a given candidate.

So, when you choose a test book, you are looking for the book with
the most helpful explanation of the question/answer.

For the Tech and General, I thought Gordon West's book was better,
because the short answers were sufficient. For Extra, the questions
are more challenging, IMO. So the more detailed explanation in the
ARRL book was helpful to me.

Jim - here is how I see it from the examiners' side of the desk.

The question pool is fixed and published because of the US Freedom of Information Act. The current pool for each element is available in books and over the internet. The pool contains at least 10 times as many questions as are required for each section of the exam. When a paper is generated, the software randomly selects from the pool, putting in the required no of questions for each part according to the weightings. An individual question could turn up as Q 3 on one paper and Q 6 on another etc. Each Q has one attractor (correct answer) and three distractors (wrong answers), but even if identical questions turn up on separate papers, the correct answer might be option a) on one paper, but (say) option d) on the second. When printed, each paper carries a multi digit signature on the front cover, four characters of which tell the VEs which template to use when marking the paper.

Hope this helps a little.

That is a good reason to know the material, rather than trying to
memorize it. Contrary to popular belief, the answer is now always "C". :)

Yes I would advocate learning the material rather than just trying to memorise. Having said that, one of the best ways to learn material after you have done your basic study is to do as many past/practise papers as possible. Go through the questions that you get right and especially those you get wrong - going to the appropriate study sections in the text books. When the same and/or similar questions come up, you will recognise them and start to get them right.

One of the important things as an examiner is to settle the candidates before they start a test. If you can do this, you find out what the candidates can do, rather than underlining their weaknesses. It is very easy to intimidate people and make them fail. What is really required is to help candidates to show you their true level. I have looked through lots of papers. In some cases it is obvious that people are not ready. You can still let them down lightly, but the msg has to be, "Go and do some study". In other cases, discussion can elucidate the fact that material was often understood, but that exam nerves or whatever took over, questions were misunderstood, etc etc. If they are within a question or two of the pass mark, then it is worth encouraging them to have another go. A pat high up on the back works a lot better than a kick lower down.

73 de Peter - GØFIM / AA3JN

Why do creditors always have better memories than debtors?

I determined that the CAT port was defective and sent it back the Yaesu. I just got a post card from them saying that non warranty repairs might take longer than warranty repairs. I am still hoping to get it back next week.

25214. Filter and CW Questions

Yahoo group: FT897 (2009)
Date: 2009-03-01 04:09:50 UTC
From: ryan_ab8xx
Topic: 25214 Message: 25214

Hello all,

I have had a FT-897 since 2003 when I got my license. It has been my main HF/VHF rig. It is fine for most of what I do, but am now seeing how receiver performance is lacking when it comes to CW contest and weak signal DX. I would upgrade to a "middle class" grade HF rig but really just do not want to spend $1000+ on a radio right now.

Due to this, I am considering installing a 300Hz filter for CW and digital modes. Inrad, Yaesu, and W4RT all have 300Hz filters. Which one is preferred the most? I am currently leaning towards the Inrad 300Hz. Any thoughs?

Since installing a 2.3kHz filter really does not gain you much, has anyone installed a 2.0kHz Inrad filter? How well did it perform?

Since this is an early model 2003 FT-897, is the increased performance worth spending $250 on filters? I am more interested in improving CW performance than SSB but if the 2khz filter will improve average power out for "more punch" on SSB, I would be interested.

And now a couple of other questions.

Is there any harm running full break in delay when running CW? I send at about 25-30wpm and the relay clatters away. If the delay is set for about 100ms it switches back to rx in between about every character sent. I use the narrowband DSP filter on CW and it really "slows" down the rig on full break in. Is that normal? Can it be fixed?

These may sound like "dumb" questions considering I have had the rig nearly 6 years but I am now just getting back into CW and with faster speeds.

Any comments/suggestions would be appreciated!

I have the filters in. It improves the selectivity, but not the sensitivity.

25216. Re: Filter and CW Questions

Yahoo group: FT897 (2009)
Date: 2009-03-01 05:05:33 UTC
From: Steve Yates
Topic: 25214 Message: 25216

Hi Ryan,

I have the W4RT 300 Hz filter in my FT-897D that I bought a year ago. I've operated just about every CW contest since then and the rig performs well. There is a bit of propagation delay through the mechanical filter and this causes a delay in the AGC loop. This manisfest itself as a slight pop at the begining of characters in fast AGC. This isn't unusual and probably occurs in most rigs. The addition of the DSP filter totally removes the pop.

The only performance degradation I've ever notice with the FT-897 was caused by the AGC being pumped by interfering signals (AGC blocking). This is really a problem when using the DSP filter since it operates outside the AGC loop so filtered signals will still activate the AGC. The 300 Hz filter helps tremdously in this regard. However, even without the mechanical filter and just the DSP filter you can mitigate the problem by cranking back the RF gain until the AGC is at the level of the offending signals and simply compensate for the loss by cranking up the AF gain. Not perfect but will work amazingly well. For me this procedure increases the dynamic range of the detected audio and gives the filter between my ears more data to work with in decoding CW amongst many stations.

In regards to full break-in operation the rig was designed for it so I wouldn't think you should 'expect' damage but since the relay is a mechanical device there is probably some wear on the contacts over time. I use full breakin during contests and working DX and set the delay for about 500 ms for the rest of the time. In case you haven't noticed, the relay is not in the circuit on 2m and 70cm making full break-in on those bands very quiet. Of course you probably won't get many pileups there but I did use QSK during the August UHF contest.

In regards to the DSP slowing down the rig during QSK I have no idea what you mean. I reckon I haven't experienced that one.

25218. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: Unix timestamp -125529832614 [implausible archived timestamp]
From: FT897@yahoogroups.com
Topic: 5240 Message: 25218

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB

25219. SWR Meter on the 897

Yahoo group: FT897 (2009)
Date: 2009-03-02 11:55:40 UTC
From: Selva Kumar R
Topic: 25219 Message: 25219

I have set the meter on the Display to show SWR readings, but I cant find out how to interpret the scale reading on the display for SWR.

The only reading that seems to be easily made is the Signal Strength meter (the S reading also shows a numeric display)

If the bar shows 3 markings from the left when on SWR, what does it mean (1.3:1 or 3:1)?? Is there any reference to be used similarly for power, ALC etc?.

Best 73,

25222. Data connector for HRD control

Yahoo group: FT897 (2009)
Date: 2009-03-02 13:26:03 UTC
From: Hank
Topic: 25222 Message: 25222

Hello all. I am a new owner of an FT-897, and so far I love it. I have HRD controlling the radio, and now need to hook up the audio connections. That's where I need clarification.

In the FT-897 manual, they show a pin-out for the RTTY/PSK connector. Is the pin-out they show in the manual on the radio side or the connector side? I'm pretty sure it is the radio side, but I want to make sure before I solder the connector.

Thanks for the great group, I've been reading the messages and actually learning a lot. This is the first digital radio I've owned and it is a completely new experience. My previous HF rigs were a Drake TR-4C and a Kenwood TS-520SE. I'm sure I will have more questions as I move along.

Hi Hank,
Go to the files section under "sound card interfaces"
I uploaded many detailed drawings of all the cables and
connectors as viewed from the solder side. The TinCAT manual
also has these details.
Hope it helps.

From: Dennis Smith
Topic: 25224 Message: 25224

I am planning on ordering 2 ft897d, 1 for mobile and 1 for home. I am only interested in cw. Does the W4RT cw filter make enough difference to justify the expense. Also should i order the 300 or 500 hz filters. I can't very well take the 746pro mobile so i thought i would go the 897d route.
Thanks Dennis W5VAF in ar

25225. Re: [FT897] ft897d filters

Yahoo group: FT897 (2009)
Date: 2009-03-03 02:58:16 UTC
From: kc3vo@aol.com
Topic: 25224 Message: 25225

The 300 hz filter is narrower, reduces interference better, but makes frequency matching/accuracy/tuning a little more touchy. Have you considered the FT-857? It is the SAME radio, in a smaller package, with "remote control head" capability. It might fit your mobile easier!--Operational features, power, filters, bands, etc are the same, with the exception that the FT-857 is smaller, and you cannot put batteries or power supply inside/onto the unit. The circuitry is almost identical in both radios.-73, KC3VO, Bob Curry

I am using an FT-897D for station digital and portable in my motor home. I have a small Jeep and installed the Ft-857D with the head mounted on the dash. I use the optional remote mikes on both. I used the 897 in a pickup cab but it is large with a LDG AT897 tuner attached. You might want to consider a similar option.

25230. SSB Collins 2.5 Filter

Yahoo group: FT897 (2009)
Date: 2009-02-28 13:16:56 UTC
From: Thomas Meggison
Topic: 25230 Message: 25230

Good day all, I am a new ham so please allow me to ask what might be a dumb question. I recently purchased a used 897D that has the SSB Collins 2.5 filter installed. Well, here is the question, what the heck is that? Next how do I use it. Do I have to go to a menu to turn it on? How will I notice that I am using it? Does it effect all of the bands?
I have looked around for some literature on it and can find none, it their literature on this?
I hope someone can give me some information on it, or steer me in the correct direction.
Thanks all

Tom

25233. SWR on 2m/70cm?

Yahoo group: FT897 (2009)
Date: 2009-02-27 21:51:03 UTC
From: wb1hjs
Topic: 25233 Message: 25233

Hi everyone

New 897 owner here, and using it to get back into ham radio after a 16 year hiatus. I'm still station building, and right now I have no real V/UHF antenna setup, or an external SWR meter, but I just bought an HT antenna - a Diamond RH789, which I plan to use for portable repeater usage.

According to the specs, it's a 1/4 wave @ 2m and a 5/8 wave at 70 cm, so I'd think it's be fine. however, with the rig dialed back to 5W, I'm seeing a high swr indicated on the meter and the "HSWR" idiot light on the display, everywhere on both bands. HF SWR meter performance is fine. I saw similar results with a P1 vertical antenna configured for each of the bands.

Has anyone seen similar with their meters on the two highest bands.

thanks
Mark

From: Matt Patterson
Topic: 25234 Message: 25234

Hi Guys,

I just recently aquired a 897d and have a few questions. I was looking thought the archives about batteries but couldn't find answers to my questions so I thought I would ask. Do most people use an external battery or the internal battery packs? If using a external battery how how big of one do you usually go with? About how long can you expect to operate on your chosen battery @ 20 watts?

No, you operate on MARS bands with a MARS license. The requirement to obtain a MARS license is a valid amateur radio license (I think technician class or better, but I could be mistaken on that).

Hi Guys,

There is no external connection except power (from a batt source)
No hum, just faint audio

Gonna try a master reset tonite, then probably back to Yaesu. The volume control is read by the front panel micro, the electronic volume controls are set on the main board via serial data. So not going to try to dig into 'is the right volume data being set etc. just curious before I box'ed it up, if anyone else had seen this, and been able to fix it....

You can know the theory spot on cold, and easily fail the exam.
After learning the theory, you MUST study all of the questions in the pool.
Once you have learned the theory spot on cold, you will be able to fairly
quickly master the question pool by being able to recognize the right answer
to each question. Without knowing the theory, you won't be able to learn
the sight recognition. The relationship or keywords won't stick in your
head.

But, to think that you can learn the theory and then halfway study the
question
pool and go take the exam is inviting failure.

I wouldn't recommend you study the question pool without the theory,
but you really better study and master the question pool after the theory
and before taking the exam.

In the question pool, there are a lot of really obscure questions.
Not only that, but the wording of the answer is often critical. You can
know the theory and fail to recognize the specific wording of the answer.

You have to study both in great detail.

A friend of mine runs a High Q antenna on a jeep...He has them mounted near the mirrors where the window screws are...Top of the line stuff but he was having problems and I started Googling it and it turns out that a jeep is built in pieces which cause problems with grounding between the different segments of the jeep...Antennas work best above the roof so if you can get it up there...The second best place is a hitch mount because you can tap the undercarriage as a counterpoise...I have a hitch mount on a PT cruiser where I run a Hustler antenna...It works great but you have to change resonators for each band...Your spare tire may be in the way...For 10m-40m a mag mount works great but there again you have a jeep...Start here... www.k0bg.com/ Have fun...

1) Is antenna coax connected to proper 897 antenna SO239?
[VHF vs HF]
2) 897 will not handle worse than 3:1 SWR .. and 1.5:1
will cause some foldback in power.

If you have the anetnna hooked to the proper SO239,
then the antenna or the coax is shorted/untuned.

Running with idiot HSWR light will blow finals.

I move my 897 around a lot, from home QTH to vehicle to cabin in the mountains, to offroading 4WD vehicle, and with me when I travel.

I acquired my 897 used, with one internal battery and no power supply. I initially ran it with an external switching power supply that I already owned, but fairly quickly decided that I wanted the internal supply, because it's one less thing to carry when I'm "on the move." I understand that some of the older units are noisy, but I don't have a problem with mine.

I seldom use the battery, even though you can swap the internal supply and batteries in about 5 minutes, because operating time is limited and transmit power is limited. The internal batteries are useful only when you are "off the grid" and also not near a vehicle that can provide 13.x VDC directly. If you were backpacking, they would be excellent, especially if coupled with a solar charging panel.

Whether you use the internal batteries or external depends on how you plan to use the rig, I think. If you're going to be "off grid" a lot, then I would use the internal batteries, or an external battery if you need the added capacity but don't mind lugging around a heavy external battery. In any case, you are going to be limited in transmit power when on battery because a standard 12 volt battery won't produce enough voltage, over an extended period, to transmit at full power. The 897 automatically kicks down to 20 watts max if the internal batteries are being used, and I think will do the same thing if the rig senses that it is connected to external batteries (although I can't find any documentation of that fact in the Operating Manual).

The manual says that the 897 should be capable of receiving for about four hours on one fully charged internal battery. Battery life will be lengthened if you use squelch to reduce current drain by the audio amplifier.

25245. RE: [FT897] Which antennas to use?

Yahoo group: FT897 (2009)
Date: 2009-03-04 17:38:43 UTC
From: Tedd Vidler
Topic: 25227 Message: 25245

Hi Oscar,

I also have a FT-897D and have had for several years. My thoughts for mobile are as follows:

1. I used my 897 in the front cab of a Dodge RAM with a LDG-AT897 tuner attached and even in the large cab it took a lot of room. I think you can make a better choice.

2. I have a Jeep Liberty now and there's no way on earth it will fit. I purchased a FT-857D and used the separation kit to place the display centered on the dash with a commercial type of velcro. The rig is fastened to a piece of plywood under the drivers seat. It has the same menus, and guts as the FT-897D and works great.

3. Jim Smith at Bughardts and a number of others advised against using the ATAS-120 as the only antenna. I use the ATAS on the drivers fender (hood) with a Diamond mount. I installed a Midland dual band on the passenders hood using the same type of Diamond mount with the differnt (NMO) mounting cable. They look balanced and work as well as a fender antenna can for VHF and UHF. The ATAS-120 I like although it doesn't cover 75/80 meters.

4. I now use the 897 as a station digital when at home, as my ARES portable rig and in my motorhome when travelling. I use the ATAS-120 on the motor home with a 1/4 wave spring base antenna mounted on top for UHF/VHF. Not the greatest but this system works just fine for me.

Good luck and hope you get lots of good advice on the group. Then all you need to do is sift through it all.

73, Tedd VE4VID

25246. Re: Which antennas to use?

Yahoo group: FT897 (2009)
Date: 2009-03-04 19:26:57 UTC
From: chameleon_antenna
Topic: 25227 Message: 25246

Good morning Oscar,

I own a very good Yaesu FT-897D + LDG AT-200 Pro for few months now and I've tried few different type of antennas: one for 2M - 70CM and another for HF. Now I only own one antenna to do the whole thing and it works very well. It's Chameleon V1 HF Multiband Antenna. (http://chameleonantenna.com/ <http://chameleonantenna.com/>). They also sell it on Ebay. It's a great antenna that you can use for mobile, portable and base station. I use it for base station and that's the best antenna I ever seen so far. I can tune on everything from 70 cm to 80M. No needs to buy multiple antennas anymore.

Cheers!

Carl

25247. How do I remove Monitor RF from my Radio ??

Yahoo group: FT897 (2009)
Date: 2009-03-04 20:06:47 UTC
From: fxrcurt
Topic: 25247 Message: 25247

Hi,
I know this has been hashed before but it's been a long time ago as far as I can see.
I got my FT-897D home, hooked it all up, tested transmit and receive, stored some local repeater and simplex memories.
All great and what a fine radio. Well sometimes I noticed on idle receive my S meter would flicker at mark one, Then I noticed it actually reading fairly solid between S1 and up to S5!! I was getting some RF or something in there so I started poking around my shack and found it to me my new Dell SP1908FPt monitor sitting next to the radio. I reached over and pushed the button to turn the monitor off and wala! RF Gone. I moved it as far away as my cables would permit, about 3 ft. and that helped but not always. I would clock the monitor and make some improvements but that RF would creep back in. I know you never smack electronic gear to get it going but funny I could tap the monitor and effect the S meter on my radio.
Long story short, I swapped monitors with an older DEll E153FPC (or something like that) and again NO RF. I can lay this monitor right flat on top of my radio and NO RF. To bad because my new Dell monitor is 19" flat and really beautiful. The older one is smaller about 15" and just OK.
So lesson one is "Yes it's the monitor causing RF in the radio"
And Question one is " Is there a way to find the differences between these monitors as to why one interferes and one doesn't?
Thanks,
Curtis N5FXR

The noisy monitor may have a loose shield, or loose mounting/grounding screw. Also, WHERE is your ANTENNA? If the antenna is nearby, that is also a problem! Be sure to place the antenna as far away from the computer, monitor, home electrical wiring, TV set, telephones, stereo etc. as possible--Preferably at least 20 feet above the roofline, and outdoors away from trees or other obstructions. Indoor antennas usually cause all kinds of problems!---73, KC3VO-Bob Curry

Hi Bob --

It's an HT antenna, like this: http://www.universal-radio.com/catalog/hamantht/1204.html -- I'm using a PL-259 to BNC adapter, and have the power dialed back to 10 watts. I think it's a moot point now, I think the rig just doesn't like the antenna, although I have no problems bringing up machines 20+ miles away from my shack. I'm not a repeater guy, just looking for a way to get on repeaters quick and dirty for emergency/portable use.

The rig seems to like my W5GI "Myster antenna" on 2 meters, so it's definitely the antenna -- I was more concerned that the SWR meter was "exaggerating" on V/UHF, and wanted to get other's experiences.

That antenna is critical as to extended length, you must adjust the length for the frquency being used, fully extended is OK for FM broadcast band (MUSIC/NEWS) but you need to retract it tto approximately 19 inches for 2 meters HAM use. Start at 19 inches, then change length about 1/4 inch at a time, while watching the SWR-If it goes up, adjust it the other direction! this way, you can find the optimum length. Be sure that your ADAPTOR is high quality, as some cheap ones from Radio Shack and others, have a SPRING inside, as the center conductor, and it introduces excessive INDUCTANCE for 70 cm use. (This is found most often in "Brand X" 90 degree type adaptors)---73, KC3VO, Bob Curry

Heh! You know how sometimes you get into a troubleshoot and the realize you overlooked something real basic?!? Well, that's me! I've made my living in electronics now for almost 30 years, and here once more I get bit because I didn't check to make sure the power plug was in, so to speak! That was, of course, the issue. Oh well!!

I have the Yaesu FP-30b power supply and like it. It makes for a very compact total package.

2) Don't buy the internal batteries unless you
> intend to use them soon and use them often. They're expensive and
> need to be taken care of;

I leave the FP-30 installed, and when I do run off battery power, it is from a large gel cell in a Husky Power Center. I have no idea what the amp-hr rating is, but I can operate about 2 hours with a lot of transmitting. Much longer if mostly listening.

3) Don't buy the Yaesu tuner. I bought

Hello All,
I have recently developed an issue where my SSB signal is distorted quite badly. This includes any band on SSB. The sound on FM and other modes is fine. I have been playing with digital modes, but I can't imagine what I have changed or messed up that would have caused that. Any help on this would be GREATLY appreciated!

Gabe Gabe Gabe

When you plunk down the examination fee or any money for an examination, you had better be prepared to pass the examination. Otherwise just take your money and flush it down the toilet.

"Who has the time to read the entire question pool every day?!" I did and many other smart people who tested before I took the extra exam and others who will be taking the exam in the future. If something is important enough to achieve, then it should be important enough to prepare for it. If that means reading the question people everyday, then in my humble opinion it is a small price to pay for my achievement.

Thank you for the compliment that "you obviously have the intelligence to learn the theory and apply it." I respectfully disagree. The extra exam is not to test see if you can apply theory. If it were, then people would learn to apply theory. There are hundreds of questions in the examination pool. How many minutes would it take to see if someone can apply 50 questions? It depends on the person. However the FCC and VECs made it easy for VECs to grade the exam by making it multiple choice. Multiple choice is as close to "cut and dry" (right or wrong) as you can get without making the questions true or false (yes/no). Why do you think they take the time to publish they entire question pool on the FCC website and other places? I would like to believe it is because out of the goodness of the FCC and VECs' hearts. They (the FCC and VECs) do not want people to throw away heart earned money by failing and passable examination. The FCC and VECs want people to get their ham licenses rather than buying radio equipment and operating without any training at all.

4) study the whole question pool everday. Concentrate on the
questions that you regularly miss and think of a creative way to
remember the answer.
5) Be confident in your ability and walk right into the exam room
and own the room and the exam.

Get busy passing the examination or get busy failing the examination. The choice is yours.

Subject: [FT897] Re: General Question about the Extra licence

Honestly who has the time to read the ENTIRE question pool every day?!
If you have that much time and the ability to recognize every answer
out of a several hundred item question pool, then you obviously have
the intelligence to learn the theory and apply it. That's the whole
point!!

Gabe

Hi, all. I'm brand new to HF and just got an 897D a couple of weeks ago. I have a question: I can't seem to get the CTCSS settings to stay locked in memory. If I set the PL tone for one repeater, and then use a different tone for a second repeater, the tone for the first repeater changes to that of the second. Make sense? I save each setting as it says in the manual by holding the "F" key and getting the beep, and I've also tried saving all settings as a numbered memory item. Nothing works. Is this a glitch in the firmware of my machine?

Thanks.

The noisy monitor may have a loose shield, or loose mounting/grounding screw. Also, WHERE is your ANTENNA? If the antenna is nearby, that is also a problem! Be sure to place the antenna as far away from the computer, monitor, home electrical wiring, TV set, telephones, stereo etc. as possible--Preferably at least 20 feet above the roofline, and outdoors away from trees or other obstructions. Indoor antennas usually cause all kinds of problems!---73, KC3VO-Bob Curry

Subject: [FT897] How do I remove Monitor RF from my Radio ??

Hi,
I know this has been hashed before but it's been a long time ago as far as I can
see.
I got my FT-897D home, hooked it all up, tested transmit and receive, stored
some local repeater and simplex memories.
All great and what a fine radio. Well sometimes I noticed on idle receive my S
meter would flicker at mark one, Then I noticed it actually reading fairly solid
between S1 and up to S5!! I was getting some RF or something in there so I
started poking around my shack and found it to me my new Dell SP1908FPt monitor
sitting next to the radio. I reached over and pushed the button to turn the
monitor off and wala! RF Gone. I moved it as far away as my cables would permit,
about 3 ft. and that helped but not always. I would clock the monitor

and make
some improvements but that RF would creep back in. I know you never
smack
electronic gear to get it going but funny I could tap the monitor and
effect the
S meter on my radio.
Long story short, I swapped monitors with an older DEll E153FPC (or
something
like that) and again NO RF. I can lay this monitor right flat on top of
my radio
and NO RF. To bad because my new Dell monitor is 19" flat and really
beautiful.
The older one is smaller about 15" and just OK.
So lesson one is "Yes it's the monitor causing RF in the radio"
And Question one is " Is there a way to find the differences between
these
monitors as to why one interferes and one doesn't?
Thanks,
Curtis N5FXR

25263. Using memory channels

Yahoo group: FT897 (2009)
Date: 2009-03-06 01:05:11 UTC
From: John Rabold
Topic: 25261 Message: 25263

--- In FT897@yahoogroups.com, Richard Head <kd0gdv@...> wrote:
>> I save each setting as it says in the manual by holding the "F" key and getting the beep, and I've also tried saving all settings as a numbered memory item. Nothing works. <<

Holding the F key and getting a beep does not save anything in channel memory. It cannot be used to associate a CTCSS tone with a repeater frequency pair permanently, for example.

To do what you want to do, use the numbered channel memories. To do so, be sure you are following all of the instructions in the manual in the "Normal Memory Storage" section within "Memory Operation on 'Regular' Memory Channels" (which is on page 44 in my copy of the manual).

Note that you must be using a VFO while you are doing all the steps listed (upper left of the screen will say VFOa or VFOb), but after you store settings in a channel number you must go into memory mode, by pressing the V/M key, in order to use what you did (upper left of the screen will say M-nnn, where nnn is the memory channel number). Turn the knob to the memory channel number in which you stored your settings.

From KD5LBE I have never seen so much negative talk. If you are going to carry the license you need to learn to talk the talk. The question are posted as has been mentioned before because of the freedom of information laws. The ARRL wants people to pass the test and does what it can to encourage learning the theory. You will enjoy the hobby more if you make it more than learning enough to answer 50 EXTRA questions. You need to think of the 50 question to the Extra test as passing from kindergarden to first grade. I took the test twice and the only bad part was realizing what I had missed. It was the easy questions that took me out. I took it a second time and passed. When you pass the test it will be a great feeling. You do not have to read the book every day, just work on the parts you can't remember and remember a lot of the questions are repeated with slightly different answers. When you learn the theory you can answer all of the similar questions. Be ready to pass the test a get one really big high. There are a lot more people to talk to with an Extra Ticket.

25265. Selling W4RT Batteries and Charger

Yahoo group: FT897 (2009)
Date: 2009-03-06 03:08:08 UTC
From: Jack Neal
Topic: 25265 Message: 25265

I've decided to use my FT-817 for portable work and re-install the internal power supply in my FT-897D. Therefore I'm selling my W4RT 4500 mah batteries and fast charger. These include 2 OPP-897 batteries & the OFC-897 fast charger. Both nearly new batteries and the fast charger are for sale for $199 plus shipping. Please contact me offlist if interested. Jack-W8AQ

This should have been put to bed a LONG time ago, but I will drop my 2 cents worth:

The tests (tech, general or extra) exist for one reason ONLY - to test your knowledge of the subject you are being examined for. To simply memorize the questions and answers, in my opinion, makes for an UN-SKILLED and IGNORANT operator - IN ANYTHING.

The "theory" is there so you can not only understand how this thing called radio works, but to apply it to "further the radio art".

It has become all too easy nowadays to memorize the questions/answers, go out and BUY a rig, and be on the air in a matter of hours - so to speak. Remember, some of our Elmers and old-timers not only had to prove their efficiency by testing, they had to actually BUILD their own radios. This is where the theory comes in.

Before the VE program, you had to go to the nearest FCC office and take the exam. There were no question pools to look at or memorize either. You either knew the material or you failed. That simple.

If you don't know the theory, how can you honestly properly build or repair a radio, antenna, power supply or even fabricate something you may need for your shack to have it either operate correctly, or the way YOU want it?

Do this, try to have a technical discussion with someone who only memorized the questions/answers and then come back and tell us if they were able to assist you in figuring something out or solving a problem you may be having. Doesn't work, does it? Most of us have even heard these people on the airwaves at sometime and those of us who know better just shake our heads in disbelief.

So, NO, if you are going to study, STUDY THE THEORY! ALL answers are in the theory, period! There are simply too many questions to memorize for you to HOPE you get the "easier" ones on the test you take. If you KNOW THE THEORY, YOU WILL PASS!

By the way, I am also a VE!

Dennis - N8BMB

25267. RE: [FT897] Re: General Question about the Extra licence

Yahoo group: FT897 (2009)
Date: 2009-03-06 06:52:24 UTC
From: Bruce Krell
Topic: 25128 Message: 25267

Dennis,

Your statement that all of the answers to all of the questions are in the theory
is just not accurate. You can study the theory all day and still fail the exams
miserably. As I said in an earlier e-mail, you really have to master the theory
in order to study and understand the questions, but just studying the theory simply won't cut it.

I have about 30 years experience working on electronic systems -- radar, gps, aircraft radio, missile control systems, infrared control systems, all kinds of stuff. I've taught courses in electrical engineering, digital engineering,
computer communications, radio electronics, and engineered a lot of high end systems. I know the the theory well and a lot of the practical stuff well.

But, I spent months studying the questions, for the general, the extra, and the GROL (the commercial). Passed them all with a score of 100. I can tell you that had I not had the theory and practical background, I would not have been able to study the questions well enough to even pass. And, had I not studied the questions very thoroughly, and I mean all of them, I would not have passed.

The question pool covers a huge range of information. It's questionnable -- no pun intended -- whether a single person can know all of that theory well enough to walk in and pass with minimal study of the questions.

On top of this, many times the wording of the answer doesn't always reflect the real nature of the theory.

Finally, studying the questions well and very thoroughly will really expand your
knowledge. Any question I didn't understand, I googled and found decent explanations.

At any rate, I just don't agree that you can know the theory, not spend a lot of
time studying the questions, and expect to pass just on a knowledge of the theory.

And, in fact, as you point, many of the questions have nothing to do with theory
but are experienced based. The questions on GPS were easy for me to master, having worked on a GPS system. The questions on vacuum tubes were a bit

harder, but given their role in commercial systems -- necessary for the 100,000 watt
transmitters, expanded my knowledge quite a bit.

In fact, studying the questions really hard and in great detal was part of the fun for me.

Bruce

I see your point, but answer me this Batman - outside of the Amateur service, when was the last time you were afforded the opportunity to look at your final exam BEFORE you took it? I don't remember any time I was allowed.

Same here. We don't expect ANYONE to walk in and pass with 100%. To expect that is ludacris. You pass with the knowledge you gain from studying the theory. Yes, it is nice to have the questions available to know where you may be weak and refresh that part, but, again, if you know the theory well enough, you should be able to pass at least the minimum score. It is also nice to walk in and pass on your first attempt as well, but sometimes that just doesn't happen.

Now, for you, if you had the expectation to pass with a 100% score and did so, great! I congratulate you on your accomplishment. However, you get no extra credit or certificate or gold star, etc, for getting a 100% score. You still only get your extra and the sense of accomplishment. Unless you brag to everyone you meet "I got a perfect 100% score on my extra test", no-one will know, and many others will not really care much and still others may look at you like one of those who studied the questions and has no working knowledge of the hobby and may not want to QSO with you.

Bottom line is this, though, STUDY, STUDY, STUDY! When you are ready to test come see us and good luck!

Subject: [FT897] Re: General Question about the Extra licence

From KD5LBE I have never seen so much negative talk. If you are going to carry the license you need to learn to talk the talk. The question are posted as has been mentioned before because of the freedom of information laws. The ARRL wants people to pass the test and does what it can to encourage learning the theory. You will enjoy the hobby more if you make it more than learning enough to answer 50 EXTRA questions. You need to think of the 50 question to the Extra test as passing from kindergarden to first grade. I took the test twice and the only bad part was realizing what I had missed. It was the easy questions that took me out. I took it a second time and passed. When you pass the test it will be a great feeling. You do not have to read the book every day, just work on the parts you can't remember and remember a lot of the questions are repeated with slightly different answers. When you learn the theory you can answer all of the similar

questions. Be
ready to pass the test a get one really big high. There are a lot more
people to talk to with an Extra Ticket.

and many other smart people who tested before I took the extra exam and
others who will be taking the exam in the future. If something is important
enough to achieve, then it should be important enough to prepare for it. If
that means reading the question people everyday, then in my humble opinion
it is a small price to pay for my achievement. .
>
> Thank you for the compliment that "you obviously have the intelligence
to learn the theory and apply it." I respectfully disagree. The extra exam
is not to test see if you can apply theory. If it were, then people would
learn to apply theory. There are hundreds of questions in the examination
pool. How many minutes would it take to see if someone can apply 50
questions? It depends on the person. However the FCC and VECs made it easy
for VECs to grade the exam by making it multiple choice. Multiple choice is
as close to "cut and dry" (right or wrong) as you can get without making the
questions true or false (yes/no). Why do you think they take the time to
publish they entire question pool on the FCC website and other places? I
would like to believe it is because out of the goodness of the FCC and VECs'
hearts. They (the FCC and VECs) do not want people to throw away heart
earned money by failing and passable examination. The FCC and VECs want
people to

Well, I remember buying an ARRL License Manual full of questions. I think I studied that for a few years until I either knew the answers or could figure them out. With the current question pool, I don't see as how there is a difference. You read the question, study the explanation until you know the material, or have it memorized. Some of the questions, there is no way to figure them out unless you memorize them, and then I question what are questions like that doing on the test. For instance, Why should someone have to remember the acronyms for the treaty that lets us operate in different countries unless you are going to go to that country? And if you are planning a trip,that would be the time to investigate. Also why should someone memorize the acronyms for the different digital modes?

Topic: 25271 Message: 25271

Greetings everyone.

When Licencing for the hobby of amateur radio first became available, the idea was that by passing the required standard, you could show that YOU, were proficent in the workings of "Radio".
This is still the idea.
The system of having different grades of knowledge, confined to a range of different frequencies was , and still is the best way to let beginners on to the bands.
If you are considering taking the first, easiest test, You owe it to yourself to know all there is to know, about how to run a radio station.This will include knowing enough theory to make sure you are not being issued with a "licence to kill", ... to blow up your equipment, or cause damage and interferance to others, both on the redio spectrum, and not just your near neighbour, but people all over the world.
OK, say you want a VHF licence, you do not need to know the vast range of licence Call Signs, from all around the world. But you will still need to know basic electrical theory like Ohms Law, V=IxR,,, You willnot need to know how to wind coils and make traps and filters, but you must be able to work out the formulae, if it is necrssary to build a filter for VHF.
If anyone thinks that it is possible to become a first class radio operator, it cannot be done by theory alone, and was never intended to be the way it worked.
Ham radio is a hobby.... perhaps, but it also attempts to be a self training exercise on an on going basis. It is a hands on experience, it is a practical experience, it is a learning experience.. you were never meant to know everything to pass the exam for whatever level you were atempting.
This is why you need a licence, to experiment and innovate,,,
I could go on, for a week,,, enough to say... I know all the answers, I hope I get the right questions ???? if that is your attitude,, well I t hink you belong to the group, who ask "stupid" questions here and other forums, which are not only basic electronics, but are clearly set out in the instruction manual.
Apart from being able to find a problem in your system, and fix it yourself, you save time and postage, and the repair bill. You also save embarasment of asking a question which proves you are not qualified to be a radio Ham. ... all right you do not know the insides of a modern black box radio,,, well neither do I, I just do'nt do surface mount stuff, and thats my excuse.
I have a beautiful camera which was in my friends rubbish, I took it home and now it works perfect for me,,, it has a giant photo diode sticking out through the case, and looks strange, but it cost ?300.00 and I got it for free,
I have read here about a person who binned his radio because the wee led, had stopped working, another theorist told him the audio chip was gone and throw it in the bin,,,,,
That is fine for some, perhaps the people who support the read the questions lobby...
Hospital doctors are "licenced" at various stages of experience,,, a newly qualified junior doctor will never be expected to do a heart transplant, not on his first day,,, but you get the comparison... You should be like the new doctor,, make your motto.. "some day I will be an expert at that",,,
You will never be as good as " your teacher" if you only read questions.

Before you buy a radio, do yourself a big favour,,, buy a few good texbooks, and learn a little practical work,,, spend a few more dollars on test equipment than on fancy gismos, Build your own antenna, and power supply, it will be better for all of us if you do.

This should have been put to bed a LONG time ago, but I will drop my 2 cents worth:

The tests (tech, general or extra) exist for one reason ONLY - to test your knowledge of the subject you are being examined for. To simply memorize the questions and answers, in my opinion, makes for an UN-SKILLED and IGNORANT operator - IN ANYTHING.

The "theory" is there so you can not only understand how this thing called radio works, but to apply it to "further the radio art".

It has become all too easy nowadays to memorize the questions/answers, go out and BUY a rig, and be on the air in a matter of hours - so to speak. Remember, some of our Elmers and old-timers not only had to prove their efficiency by testing, they had to actually BUILD their own radios. This is where the theory comes in.

Before the VE program, you had to go to the nearest FCC office and take the exam. There were no question pools to look at or memorize either. You either knew the material or you failed. That simple.

If you don't know the theory, how can you honestly properly build or repair a radio, antenna, power supply or even fabricate something you may need for your shack to have it either operate correctly, or the way YOU want it?

Do this, try to have a technical discussion with someone who only memorized the questions/answers and then come back and tell us if they were able to assist you in figuring something out or solving a problem you may be having. Doesn't work, does it? Most of us have even heard these people on the airwaves at sometime and those of us who know better just shake our heads in disbelief.

So, NO, if you are going to study, STUDY THE THEORY! ALL answers are in the theory, period! There are simply too many questions to memorize for you to HOPE you get the "easier" ones on the test you take. If you KNOW THE THEORY, YOU WILL PASS!

By the way, I am also a VE!

I do agree with most if not all you said here. As I got my first VK3 license in 1959 the examinations were sort of quite hard for most people which were not in the radio business. The CW speed was quite high and the technical knowledge had to be sufficient to build your own transmitting and receiving equipment. There were really non of the over the counter rigs available. I remember grinding Xtals for the crystal filters in my first completely home brew SSB transceiver. May be the tests were too hard in that days. But it was a lot of fun. Now most hams are just appliance operators and actually have a very limited technical knowledge. This can be seen by a lot of the questions asked in this forum. OK we have more hams now but as far as I can see, as the examination standarts have gone down more and more, the operating standarts seem to have gone down as well. May be I am an old fuzzy dady and expect to much, but the days when we exchanged xtal filter
data using normal xtals reground to what we needed for our rigs etc. really gave you an enormous knowledge of the technical side of radio communications. I remember the rag chews with Don Stoner or Walt Henry how to do things the best way. Well this times are gone for ever. Incidentally surface mounted components are much easier to change as the old through the hole type. HI HI HI, all you need is a gas operated soldering iron which you can use as a torch and some soldering paste. So no regrets.

25277. Re: [FT897] Re: General Question about the Extra licence

Yahoo group: FT897 (2009)
Date: 2009-03-06 14:47:56 UTC
From: D F
Topic: 25128 Message: 25277

My point exactly. I know there items in the test that make no sense at all. However, if you believe that bit is not going to benefit you then you can concentrate on something else.

BUT!

I was just like you, didn't think I needed to know the digital stuff or other items, then I got interested in it and had to go back and study it again. NOT to say you NEED to know it, but it does help, especially to pass the exam.

My other point is this: Studying the questions/answers alone ONLY gets you a pass. It really does little to help you understand WHY something is the way it is or HOW it works. I believe the ARRL made a BIG mistake by making the only question pool available to study. One of the reasons the FCC WANTS you to have your license, if you remember, is to "Further the radio art". You CAN'T do this if you don't know HOW OR WHY things work. The ARRL is really only interested in the numbers. That is, HOW MANY amateurs there are. The more amateurs, the bigger voice, so to speak. That, really, is the reason the pool is available. To me, it makes for an un-informed operator that has little to offer the hobby and DOES NOT help to "Further the radio art".

Yes, it is absolutely nice that you can go and BUY that radio, BUY that antenna, BUY that power supply and BUY that tuner. But what happens if any of it fails? Could you diagnose the problem on your own to determine if YOU could repair it and save LOTS OF MONEY in doing so? Eventually that warranty expires and not everyone has the money to "throw away" to send something in for repair. You would be amazed at how inexpensive MOST repairs actually are. MANY parts are actually less that $1.00 (ONE dollar) and sometimes easy to repair/replace. Can YOU build your own antenna? MUCH cheaper than commercially manufactured ones and in many instances they work BETTER. What if you wanted to design and build SOMETHING that would help either yourself or other hams? Design, build and test a new MODE of communication? You NEED to know the theory on how all those little parts integrate and relate to eachother so it works properly. Or, suppose you are causing interference to your neighbor. Could you properly advise him on the correct filters for his/her equipment to eliminate the interference?

Not to mention that the "downtime" to your radio will be much less.

There really is more to this hobby than just BUYING everything you need to get a station up and running. Too many hams are out there already that don't know much about this hobby other than hooking up the power and coax and keying the mic. I'll give you an example - this is a TRUE incident:

A local (unnamed) ham borrowed an HT from another. Something went wrong while he had it. He couldn't figure out HOW TO OPEN THE CASE so he took a soldering iron, melted open the case, couldn't figure out what all the parts were or where the problem was (he didn't even KNOW what a MULTI-METER was!!!!!), put the case back on and took a screw and screwed the case to the board right in the middle of the front of the radio thereby rendering the HT to junk and gave the HT back to whom he borrowed it. This gentleman is one of those who admits to studying ONLY the questions/answers to pass the exam and has almost no knowledge of

electronics. And now he holds a General License!

Lastly, if you are going to only study the questions/answers, I would HIGHLY suggest having AT LEAT these two books handy for reference;

The ARRL Antenna Book
The ARRL Handbook

It is my opinion that an informed amateur is a better operator, and therefore, better helps to promote the hobby and "Further the radio art".

Subject: Re: [FT897] Re: General Question about the Extra licence

Well, I remember buying an ARRL License Manual full of questions. I think I studied that for a few years until I either knew the answers or could figure them out. With the current question pool, I don't see as how there is a difference. You read the question, study the explanation until you know the material, or have it memorized. Some of the questions, there is no way to figure them out unless you memorize them, and then I question what are questions like that doing on the test. For instance, Why should someone have to remember the acronyms for the treaty that lets us operate in different countries unless you are going to go to that country? And if you are planning a trip,that would be the time to investigate. Also why should someone memorize the acronyms for the different digital modes?

Oh! The HT anecdote ruined my whole day - I've seen and heard of similar things in my area. Oh again! Could the reason for creating more amateur radio licensees by (1) The test "dumbing down", (2) The many "one day cram" courses followed by a test session, and (3) The current study method of memorizing answers rather than learning the material, have anything to do with the "industry" wanting to create a larger market for their products? I wonder.

I was going to mention that as well, but thought better not to. It is not fact that the manufacturers have a hand in this, but as you point out, there are many who believe this is also the case.

I took a class that lasted 8 weeks for my Technician license, but I tested out after 6 at a local swap. While I only passed with like 82% or thereabouts, I was satisfied with the result. Would it have been nice to score 100%? Sure. Who doesn't? But as I stated you get nothing extra out of it other than "bragging rights".

I studied the General on my own for about 2 months and TOGETHER with the practice exams from QRZ passed again around 80%. I had a wonderful elmer who had been in the hobby since the 50's until last October when he went SK and the info and advice he gave was absolutely helpful.

The knowledge and ability is something that continues WELL AFTER you pass. I don't know of ANY ham who "knows it all" and they, too, always learn something new.

I love this hobby and love tinkering with and repairing things as well. Don't think I would have been able to if I didn't know the theory.

25280. RE: [FT897] Re: General Question about the Extra licence

Yahoo group: FT897 (2009)
Date: 2009-03-06 17:25:22 UTC
From: Bruce Krell
Topic: 25128 Message: 25280

Guys, I wasn't trying to brag.
Frankly, there is NO difference between 100% and 80%, both pass.

I simply was trying to clarify a couple of issues, that I will now try to state succinctly again:

-- you really need to know the theory to pass the exam
-- you really should have a lot of practical experience to pass the exam
-- there is a lot of stuff in the exams that have nothing to do with theory
-- you should use studying the questions and the answers as an opportunity to expand your knowledge in the area of radios and radio electronics
-- thinking that you can just study the theory alone and pass is foolish
-- thinking that you can just study the questions alone and pass is also foolish
-- thinking you can just study some abstract theory, lightly study the questions,
and walk in and pass the exam is foolish
-- frankly, taking a prep course and memoring exam questions undermines the hobby

Look, the pool is 1500 or so questions. You'll get 100 of them on the extra class exam.
To lightly brush over any question because you don't understand is dangerous.
All it takes is a few of those on your exam and you're hosed.

So, Dennis, I was agreeing with you -- apparently we were in violent agreement
here :), but simply trying to say that if you want to pass,
you need to really think about going the extra step and take studying the exam pool
as a serious task AFTER you have mastered the theory. But theory alone just won't cut it.

As far as opting out of the technician class early to pass, I honestly think that
having an 8 week class to study the technician materials is overkill. The amount
of substantive knowledge in the level of exam is small. The question pool does
an excellent job of insuring that a licensed technician has a sufficient knowledge
of the rules and technical expertise to participate within the VHF/UHF bands.

This is an entry level license, and you want minimal requirements for entry. Do you really want to make it so
hard that the industry dies? Is your personal ego so self-centric that it's all about
you and some sense of superiority or are you really interested in promoting the
hobby? What would happen if the entry level was so hard that people couldn't enter
and the manufacturers go out of business? You can't get radios, you can't get
technology. And, people who enter at the first level are not really going to be
building radios and antennas. So, let's all get beyond the dumbing down accusations
and try to think about the long term viability of the hobby. Just look at the last few QSTs
from ARRL and the rise in General and Extra Class licenses issued. This is great for all of us,
because the manufacturers will continue to provide all sorts of cool equipment.

By the way, Dennis, the attitude in your e-mails is unnecessary. We are all a group of like
minded persons who are interested in the hobby and its advancement. All of us were
simply trying to have an informed discussion about an issue and were trying to
succinctly state our opinions and justify them. The condescending attitude just
doesn't help the community. So, please show a bit of respect for the rest of us
who try to respond. (I'm taking umbrage with your insult to Batman here).

Maybe I'm misreading your e-mails, if so, I apologize.
But, your tone just doesn't cut if for me.

Bruce Krell, AE6VG

Diamond K400C is what I have to mount my Atas 120 to my car. It's very easy to install just make sure that you becareful how you run the coax into you vehicle. I have a Toyota Matrix and was running the coax along the hatchback opening. I ended up ruining the coax. I know have it going through my glass window which opens up and I have no problems with it. Do you have a hard top on it or a soft top. You shouldn't have any problems with a soft top. Good luck let me know if there is anything else I can help you with this. 73

I used the 857/ATAS100 setup in my Explorer for years with the ATAS on a Diamond K400C at the right rear corner of the tailgate. Worked very well and I worked lots of DX driving down the highway. The Explorer has the problem a lot of older Fords had with a very noisy fuel pump, for which there was a factory TSB that installed a noise filter at the pump. That helped a lot, but even better was using a ClearSpeech noise-cancelling speaker that makes HF like listening to VHF FM.

I bought a new Mustang last year and swapped the rig over to it (still have the Explorer, but just use for work around the Farm and in snow). Good news is that the Mustang does not have the RFI from the vehicle computer and fuel pump...it is dead quiet on HF. The ATAS is on the truck lid with the same K400C mount and the 857 is split from the trunk to the control head on the overhead console.

25293. Re: [FT897] Re: General Question about the Extra licence

Yahoo group: FT897 (2009)
Date: 2009-03-06 02:08:18 UTC
From: Robert
Topic: 25128 Message: 25293

Mr. Nelson made a valid point regarding passing and emotion that comes from passing the Amateur Extra exam.

Failing is painful when it is thought that you put enough work and sweat into a project. It is even more painful when the project costs money. This is why it is better to put your efforts into preparation beforeyou plunk your money down on the table to take the examination.

As Murphy (of Murphy's Law) so aptly put it:

"Work smarter not harder and be careful of your spelling."

From: Stewart Nelson <morriltonmayor@...>
To: FT897@yahoogroups.com
Sent: Thursday, March 5, 2009 5:08:50 PM
Subject: [FT897] Re: General Question about the Extra licence

From KD5LBE I have never seen so much negative talk. If you are going to carry the license you need to learn to talk the talk. The question are posted as has been mentioned before because of the freedom of information laws. The ARRL wants people to pass the test and does what it can to encourage learning the theory. You will enjoy the hobby more if you make it more than learning enough to answer 50 EXTRA questions. You need to think of the 50 question to the Extra test as passing from kindergarden to first grade. I took the test twice and the only bad part was realizing what I had missed. It was the easy questions that took me out. I took it a second time and passed. When you pass the test it will be a great feeling. You do not have to read the book every day, just work on the parts you can't remember and remember a lot of the questions are repeated with slightly different answers. When you learn the theory you can answer all of the similar
questions. Be ready to pass the test a get one really big high. There are a lot more people to talk to with an Extra Ticket.

>
> When you plunk down the examination fee or any money for an examination, you had better be prepared to pass the examination. Otherwise just take your money and flush it down the toilet.
>
> "Who has the time to read the entire question pool every day?!" I did and many other smart people who tested before I took the extra exam and others who will be taking the exam in the future. If something is important enough to achieve, then it should be important enough to prepare for it. If that means reading the question people everyday, then in my humble opinion it is a small price to pay for my achievement.
>

> Thank you for the compliment that "you obviously have the intelligence to learn the theory and apply it." I respectfully disagree. The extra exam is not to test see if you can apply theory. If it were, then people would learn to apply theory. There are hundreds of questions in the examination pool. How many minutes would it take to see if someone can apply 50 questions? It depends on the person. However the FCC and VECs made it easy for VECs to grade the exam by making it multiple choice. Multiple choice is as close to "cut and dry" (right or wrong) as you can get without making the questions true or false (yes/no). Why do you think they take the time to publish they entire question pool on the FCC website and other places? I would like to believe it is because out of the goodness of the FCC and VECs' hearts. They (the FCC and VECs) do not want people to throw away heart earned money by failing and passable examination. The FCC and VECs want people to

Topic: 25295 Message: 25295

Up to recently, I was able to run 30 watts with no problem. All of a sudden, the radio will put out 10 watts max, regardless of input volume, etc. Setup: 897D to home brew interface with ground isolation, older Dell laptop, digipan. On other modes, it hits all normal power levels, so at least I have not toasted the finals! There have been no changes in the setup or equipment. Oh, by the way, this is on all bands.
Any help is appreciated!

I'm interested in the batteries and charger, assuming that they're functional and hold a charge. How do you prefer payment?

I too would agree that the Diamond mount would be the best one to get. I first bought the Comet CP-5m and was constantly adjusting it. I later got my hands on the Diamond K-400 and never had a problem since then.

> >
> I used the 857/ATAS100 setup in my Explorer for years with the ATAS on a Diamond K400C at the right rear corner of the tailgate. Worked very well and I worked lots of DX driving down the highway. The Explorer has the problem a lot of older Fords had with a very noisy fuel pump, for which there was a factory TSB that installed a noise filter at the pump. That helped a lot, but even better was using a ClearSpeech noise-cancelling speaker that makes HF like listening to VHF FM.
>
> I bought a new Mustang last year and swapped the rig over to it (still have the Explorer, but just use for work around the Farm and in snow). Good news is that the Mustang does not have the RFI from the vehicle computer and fuel pump...it is dead quiet on HF. The ATAS is on the truck lid with the same K400C mount and the 857 is split from the trunk to the control head on the overhead console.

Hi folks
Here's a daft question? My colleague has an atas type antenna that auto tunes to what ever band he's on. Does the tuning facility make much of a difference to receive as when we tried it and tuned it up,more stations came flooding in once it was tuned. This is a receive only question as I know it does on tx.

I went ahead and ordered two K-400 mounts. One for UHF/VHF and the other for HF. I now need to figure out if I need to find the right spots for them.

Thanks for the feedbacks...

25307. Noise levels of the 897 vs. the 450

Yahoo group: FT897 (2009)
Date: 2009-03-11 14:57:13 UTC
From: willgord
Topic: 25307 Message: 25307

I own an 897 and am stuggling to work HF from a Manhattan apartment.

Recently had a chance to work a Yaesu 450 and was immediately struck by how much quieter the 450 is compared with the 897 as I dial through 20 meters. Far less background noise to overcome with DSP, etc. than I find on the 897.

I realize this may not be a fair comparison, since the 897 feeds a Super Antenna mounted in the apartment, with a quarter-wave counterpoise hanging outside the window, while the 450 feeds an external dipole.

Still, my best efforts to quiet the 897 don't come close to matching the noise level on the 450, even with DSP off and no filters in use.

Any thoughts on this--including ideas for quieting the 897--would be appreciated.

Gordon -

Under the test conditions you are using, your observations may be
valid. However, the test conditions are (as you admit) are not equal.

The FT 897 has a super receiver in all respects and using the proper menu
settings, you should have a rig which in all respects outperforms the FT 450.

Both rigs must be compared using the same antenna. A coax switch can be
used to compare the rigs on the same antenna to make an A/B test. Just DO
NOT TRANSMIT or you will probably blow the front end out on the receiving rig.

Again. When making comparisons, the test conditions must be equal.

I am experiancing the same issue. I have a Kenwood R-1000 that seems to recieve signals much better than my FT-897. I am in a townhome, and have a 19' dipole in the attic being tuned by an LDG AT-897.

I do believe that it has to do with my antenna (can't compare to an outside antenna), the band conditions, and my radio menu settings. My previous HF rigs were a Kenwood TS-520SE and a Drake TR-4C. This is a far more advanced radio than I have ever had before. Does anyone know of a guide or book that explains the menu options and what the results are for certain settings? The manual explains what the settings are, but that doesn't really explain what the settings will do when enabled/disabled or set at certain levels.

Thanks and 73,

Hank / KB4MTO

Gordon,

It was not a fair comparison. At least use the same antenna for the test. Indoor antennas are usually overwelmed by indoor noise sources and this is probably the root of your problem. When noise is picked up by the antenna a receiver will have a hard time dealing with it.

I don't know much about the FT-450. If it has DSP at the IF then it may be more effective at mitigating noise in some cases.

To All:

Within the next week, we will be announcing a web site devoted to this very idea --
providing articles that will give useful operating information.

This site will have a solicition and guidelines for submitting articles, a sample
theoretical article and a sample practical step-by-step operational article.

The sample articles will not only be useful but will be examples of what we would like to see.

Stay tuned for the announcement.

25316. Need: (1) Can of Factory Smoke for FP-30 Power Supply

Yahoo group: FT897 (2009)
Date: 2009-03-11 23:35:02 UTC
From: Jerry Steele
Topic: 25316 Message: 25316

I turned on my FP-30 a couple of weeks ago and the factory smoke came out. The radio is fine, but the power supply needed to go back to Yaesu for an estimate.

After their call yesterday, all I could say was "HOLY SMOKE" !!! They wanted $5 less than a new supply for the repair! They said it was two transistors and they were $77 each! I found the technical manual on line and looked up each of the transistors listed. I couldn't find one more than $4 each.

I told them to charge me the bench fee and send it back.

Does anyone have any idea where to start with troubleshooting the supply? They wouldn't send me just a can of smoke!

Look for a schematic for it and order the transistors. Most likely some resistors are also fried.

I turned on my FP-30 a couple of weeks ago and the factory smoke came out. The radio is fine, but the power supply needed to go back to Yaesu for an estimate.

After their call yesterday, all I could say was "HOLY SMOKE" !!! They wanted $5 less than a new supply for the repair! They said it was two transistors and they were $77 each! I found the technical manual on line and looked up each of the transistors listed. I couldn't find one more than $4 each.

I told them to charge me the bench fee and send it back.

Does anyone have any idea where to start with troubleshooting the supply? They wouldn't send me just a can of smoke!

Hi all
Please don't shoot me down for what I am about to say but I have been using my 897 for about 2 years suffering from this very problem and only just found this out from a non judgmental mate... :-)
It may be novice stuff but if you don't know it might as well be rocket science...lol A wise man once said to me "There is no such thing as a dumb question" If you don't know then you don't know The dumb thing is not to ask the question.

Right here we go....

1/ Tune you main dial to find a station in the noise.

2/ Press and hold in the F key to get you into the menu(#6 on the plan page 12 of the manual)

3/ Go to menu #80 and rotate main dial for RF-Gain.

4/ Go back to VFO Mode by pressing Key

5/ Adjust the Squelch/RF knob till you get the signal strength to just between S8 and S9

6/ Press and hold in Clar/IF Key (#11 on the plan) until a round black dot appears at the end of the frequency on the LCD screen

7/ Now just turn clock or anti clock slightly to alter The IF slightly and you will be amazed how the audio of a week signal comes out of the mush of noise.

Play around with both the RF gain and IF till you get it set how you want...I was gob smacked by the result I achieved.

Hope this helps everyone

Ian

Every so often, I play a music file in windows media player, and the internal synth gets turned off. I have to open VOLUME CONTROL and manually reset the volume for the internal synth to be able to hear MIDI music again.

DOes this quick mix program fix that some how?

http://www.ptpart.co.uk/quickmix/

25329. short trip

Yahoo group: FT897 (2009)
Date: 2009-03-14 02:37:36 UTC
From: Matt Patterson
Topic: 25295 Message: 25329

Hi Guys,

I've got to take a short business trip and was thinking about taking along my FT-897D to pass the time at night while in the hotel room. However, the only small power supply I have at the moment is a 12A Pyramid power supply. I was wondering what kind of power I would be able to run the 897 at with only 12A at my disposal. I plan on purchasing a Jetstream 28A power supply but it won't be here in time for this trip.

From: pdouglas12@aol.com
Topic: 25284 Message: 25332

I found the license plate mount, made by Lakeview is very strong, and seems sturdier and safer than the K400, though I have a K400 for my VHF/UHF combo. You can see my installation in the photos section of the FT-857 group listed under Lexus 350 installation. BTW, it is very well grounded at the base, inside the trunk, and the ATAS-120 likes it just fine.

25333. Buy FT-897 vs FT-950

Yahoo group: FT897 (2009)
Date: 2009-03-08 22:03:14 UTC
From: ak40f
Topic: 25333 Message: 25333

I know there is quite a difference but here is my dilemma. The 897D has VHF and is small to take with me when I travel to VA. However, I am not sure I am a fan of all the menus to get things done. The 950 has less menus and more controls, better receiver, but no VHF and is larger to haul. So, if you have had experience with both what do you suggest. I keep thinking I have the HT for VHF and can always go mobile.

Thanks for your thoughts,
George

My guess is they wouldn't repair it. They would most likely just replace it for what they are charging. Thats why I didn't get the internal PS. Do you travel with it often enough that you can't take and external PS? I use a MFJ MightyLite 25W PS. It's a small size and fits in my backpack that I travel with.

good luck if you try to fix it.

check for the menu option RF POWER

this will limit to what ever you set it to

Generally, I set 75% of the rated maximum for HF/6, and max 30 for 2/70

Cheers

I understand that, but it's not an option for this trip. The 12A PS is what I have to work with. I still think I'm going to go with the jetstream when I do purchase another power supply to use for things like this instead of the internal. I know it's a extra piece of equipment to have to lug around but it's less than half the cost and only weights 4lbs. Plus I can use it with other equipment as well.

Hi Guys,

I've got to take a short business trip and was thinking about taking along my FT-897D to pass the time at night while in the hotel room. However, the

only small power supply I have at the moment is a 12A Pyramid power supply. I was wondering what kind of power I would be able to run the 897 at with only 12A at my disposal. I plan on purchasing a Jetstream 28A power supply but it won't be here in time for this trip.

Cripes Dennis... the original question was asked in the 857 forum, not here. My mistake. But, as mentioned, TX error tells me just what you said.. Either he's not in memory mode or not a D model.
Both my 857D and 897D have the 5mhz capabilities except the 897 has the Mars mod so I had to put the 5mhz channels back in.

From: Lew Phelps K6LMP
Topic: 25295 Message: 25352

the 897 requires 22 amps power supply to transmit at a full 100 watts. If you dial down the transmit power to 40 watts or so, you should be OK to operate with your 12 amp power supply.

I suspect that the FT-897 will tell you if you're not providing it enough power; it will simply refuse to transmit as soon as the voltage starts to drop. I suggest a little test- start at about 30 watts, transmit briefly on FM, and watch the supply voltage shown on the front panel. it should begin to drop sharply when you approach the limit of the power supply; back off from that point.

also remember that most switching power supplies have built-in overload protection, so they will also shut down if asked to do more than they can.

BTW, having used an external power supply for my rig when I first got it, I rather strongly recommend springing the bucks for an internal supply. it not only is one less piece of equipment to lug around, but also it makes for a cleaner, neater operating area in your shack.

It will receive just fine. You will have to adjust the transmit power to a lower value. I think when it operates on batteries, the output drops to about 20 watts, so you might start there. You could put a volt meter on the power supply and increase the power until the voltage starts to drop, however, the best way would be to put an ammeter the power leads and see what power you can get out of it while limiting the current to 12 amps.

Matt,

You should look into the SAMPLEX "SEC 1223" 23A 12 vdc switching power supply...It's under $100, small, lightweight and, they have a great technical support dept. AES has them and probably HRO also.

Just a thought.

There is a section in the 'maintinance' software set up where you can reduce the minimum power out as well on vhf (may be hf as well) down to 1 watt , which is handy for transverter use .. saved me a lot of relays and things

G ..

Hello to all. need some information....Have an 897 that has developed a problem with the front end audio. This one of two 897's and on the same antenna the other seems to be getting about twice as much audio thru the speaker. When it is a loud signal, it is very loud, AGC doesn't seem to be working at all.

Is there a repair facility some where in the south east? My eye site aint good enough to tackle this one. Thanks....Cliff/WB4DPP/NNN0JKI

Cliff -

You haven't indicated whether the rig was modified in anyway and/or if any of the factory settings have been changed.

If you are using an external speaker, make sure that you are using the correct jack configuration.

Just for fun. Mark down your current menu settings on a piece of paper and do an all reset on the rig.

25368. [FT897] Antenna for 897D

Yahoo group: FT897 (2009)
Date: 2009-03-15 20:22:24 UTC
From: Adam Filkins - KD8CCX
Topic: 25364 Message: 25368

Hello All,
I am looking to make an end fed long wire antenna. I have an 897D with an LDG AT-897 auto tuner. My question is about grounding. I have heard a hundred different stories about what type of grounding system I need for this. Can anyone share with me a good design that will not feed RF into my shack and cause me a trip to the burn ward?

I am not running an amplifier. I would like to make the antenna about 240' long.

Any info is appreciated! Thanks!

25371. RF grounding for noise reduction... any thoughts? (long post)

Yahoo group: FT897 (2009)
Date: 2009-03-16 02:05:31 UTC
From: Shane Wolfe
Topic: 25371 Message: 25371

Greetings all,

I picked up an FT-897D last October when I joined Army MARS. Everything has been working great except for the level of noise found at or around 80/75m. On a good night, the level of noise is sitting at S9 or S8. This has been consistent since purchasing the rig in October. The noise is just static and there doesn't seem to be any discerning characteristics that I can attribute to any particular source, making this a bit hard to troubleshoot (and sometimes very frustrating). The radio is almost unusable at the aforementioned frequencies.

My setup:

FT-897D and all other station equipment share a common ground point (1/2 inch braid) to the ground lug on an MFJ-949E Versa Tuner. The 949e is grounded by 1/2" braid the the grounding lug on an MFJ window passthru panel. I have three antennas connected to the passthru, all sharing a common ground at that point.

The panel is tied to a copper clad rod right outside the window via 1/2in braid. I have another ground rod 15 feet away with a run of the #6 solid copper wire buried 1/2in under mulch from the rod next to the window.

Antennas:
Carolina Windom 160 Special
B&W Folded Dipole (65ft version).

Both antennas yield the very similar static/noise issues, though it's a little better on the B&W (1 S unit down in noise).

I've eliminated almost all of the devices in my house as the culprit by going through each breaker while running the radio off of battery power. Same results...

Would running a radial the same length as the Windom (130 feet) of #6 wire around the house (ultimately tied to the panel) help at all? Anyone out there using a similar setup?

I understand that my location will have lots to do with this (I DO live in a suburb of Baltimore/DC), but at least two other operators that are close to be do not report the same noise problems with similar setups.

Any thoughts or ideas are GREATLY appreciated.

Shane

Read this and give it a try

http://www.hamuniverse.com/grounding.html

Here is an excerpt.

*We could not tune the antenna on most frequencies and we kept getting zapped from the radio or microphone when we transmitted. Also, our signal reports were lousy. SO, after consulting some experts, I added 250 feet of counterpoise around the building consisting of some bare 6 gauge copper wire I had. The radio was on while I rolled it out and a friend was listening to the broadcast on 40 meters, (OK it was night time---best time to do antenna work right!) Anyway he reported the broadcast was only about S 4-5 on meter. As I rolled out the counterpoise it rose to 40 over S9 and came in much clearer. We were able to tune everything easily now and SWR was rock stable. When we did a signal test, the station we had talked to before accused us of running a contest amplifier. We could not convince them it was only 100 watts, same as before and the same antenna! *

I'm in North Central Texas and have the same level of noise on 75/80 most of the time. Higher bands are, as expected, quieter. Personally, I don't consider it a radio problem, but rather a characteristic of band conditions.

If you find a cure for it, I'd love to hear it <G>. Best of luck.

You might be getting line noise, from the power line, or noise from a UPS-either yours or a neighbors! Remember, a UPS continues to work even after the A.C. breaker is off. Anything in your, or nearby homes, can be the culprit, especially battery chargers, switching power supplies, Plasma TV sets, arcing powerline hardware, oil furnace igniters, electric fences, etc. If all else fails, I am local, perhaps one day I could assist you in person. 73, KC3VO-Bob Curry

Bob,

I have some high tension lines somewhat close to the house here in Odenton. I'm not sure what the neighbors have around, but I wouldn't be surprised in the noise isn't coming from right under my nose. I'm pretty much on top of 5 surrounding lots, with the antenna being strung between two houses...

I'm sure I won't completely eliminate it, but any improvement would be great. I might take you up on your offer if I can't sort it out in the next few weeks... Thank you!

I am in Reno, Nevada, and during the day until early evening...7pm (local) or so, the noise level on 75/80 is unbearable. In the evening it quiets down to S3-S5.

The noise sounds atmospheric to me!

BTW..like the call....K5WLF...Bert Shane has chuckled too!

Hello Bob. This rig has been hooked to a MFG-1279 for the last three years and other than the frequency changed, none of the parameters have been changed. This rig is hooked to a computer and I use it mostly (85%) for digital.The agc on (auto) With digital, don't use the dsp or dnr. If the squelch was set to tight, it would have no audio coming thru at all or be intermittent.

Pulled it out of its place this afternoon and removed and replaced all the connectors. Audio came up but condx were excellent on the net tonite. I heard stations I usually have problems with on the other rig. Waiting (sounds strange) for bad condx again to compare the two rigs.

Thanks for the suggestions, I do appreciate the comments. Aint given up yet, but I gotta be realistic as well....Cliff/wb4dpp/nnn0jki wb4dpp@...

Hello Jay. The rig has been opened (both of them have been) up for MARS and works very well on all freqs we use. May have found the problem yesterday. Unplugged all the connections and then replaced them. Seems to have helped. At least I am getting a reading on the s meter now. Wasn't getting that before.

Thanks for the help...Cliff/wb4dpp/nnn0jki SC.

Shane,

You didn't say whether or not you had the IPO switch on (preamp off) or the attenuator on. On 80m/75m the FT-897D has way more sensitivity then it needs for an acceptable S/N ratio. Unless you are using a specialized receiving antenna such as a Beverage the attenuator can be almost always be left on when on 80m. If the noise level is S8 or S9 with the attenuator on then you have a noise problem. Otherwise you are just listening to the natural noise level of the band. In the winter the noise will sound like broadband white noise but in the summer you may hear 40 dB over S9 static crashes.

Just for reference, right now at 1430 UTC (quiet time of day) my noise level on 3560 kHz is as follows:

Default setting (max. sens.) = S8/S9
IPO On (preamp off) = S7/S8
ATT On = S1

This is using a resonant 1/4 wave length inverted-L antenna here in north Texas. Before taking extreme measures to solve your noise problem I would first confirm that you really have a problem.

If you find that your noise level is probably normal then you can make it more tolerable by playing with the attenuator, RF Gain, and DSP settings.

If you do have a problem some major noise sources to look for are things like TVs (especially plasmas), AT&T Uverse systems, battery chargers made in China, etc. Good luck.

>You didn't say whether or not you had the IPO switch on (preamp off) or the attenuator on. On 80m/75m the FT-897D has way more sensitivity then it needs for an acceptable S/N ratio. Unless you are using a specialized receiving antenna such as a Beverage the attenuator can be almost always be left on when on 80m. If the noise level is S8 or S9 with the attenuator on then you have a noise problem. Otherwise you are just listening to the natural noise level of the band. In the winter the noise will sound like broadband white noise but in the summer you may hear 40 dB over S9 static crashes.

25384. Re: Antenna for 897D

Yahoo group: FT897 (2009)
Date: 2009-03-16 17:16:32 UTC
From: ve3wmb
Topic: 25364 Message: 25384

Adam :

The simplest answer is that you should use as many ground
radials as practical, minimum length of 1/8 wave on the lowest frequency you plan to use the antenna for. Wire size doesn't matter much, nor does it matter whether you lay them on the ground or bury them a few inches. If the number of radials is less than about 20 then there will be very little difference in performance whether they are 1/8 wave or 1/4 wave at the lowest operating frequency.

If the shack is not on the ground floor then try using one 1/4 wave radial per band (insulated wire) run around the shack. You can use something like multi-conductor rotator cable with each conductor cut to about 1/4 wave for a different band, but I would suggest that you try to splay out the last 2 or feet of each of the conductors (at the end opposite the tuner) from the rest to avoid interaction. These wires can all be connected in parallel to the ground connection on your antenna tuner.

Also keep in mind that any arbitrarily chosen end-fed wire length is certain to present a high impedance on one or more bands, this is because it likely that the length will be close to an even multiple of 1/4wave on one or more of the bands. (The impedance of an end-fed 1/2 wave wire ranges from about 3000 to 5000 ohms). So unless you have very wide range antenna tuner (hint: most auto-tuners won't handle this, with maybe the exception of SGC's ATUs) you will need to be careful what length you select. There is a very good article called "Taming the End-Fed Wire" from an RSGB publication who's name escapes me.

This article has a diagram showing some recommended non-resonant wire lengths vs Amateur Bands. Let me have a look for this and I can suggest at least one length in the 200ft range that should hopefully minimize tuning problems for you.

Best of luck.

25385. Programming Question

Yahoo group: FT897 (2009)
Date: 2009-03-16 18:49:59 UTC
From: Adam Karsin
Topic: 25385 Message: 25385

Hi everyone,

I am about to do a major overhaul on the programmed memories,
some frequencies will stay the same and some will change, I wanted to be
able to move channel information up and down to make room for new and
reposition some for ease of use. I seem to remember doing this in the past,
but now it seems that I can only insert and delete which causes either the
top or bottom channels to be deleted.

Any information and assistance is greatly appreciated.

73,

Adam

I believe there is a computer program that will let you do this very easily. It is the 857/897 programmer. After you have used it one time you will never want to go back again.

Larry, I agree. I'm in southern Lousiana, and I am sure you probably hear some of the same nets I do, HiFivers (3.908), Tailgaters (3.916), etc.

When I am having a noise problem on 80 meters, it is also reported by others on those nets in TX, OK, AR. When my noise is down, it is also commented on by others.

One thing that REALLY helped and made it bearable was adding a BHI, Inc. DSP module. I purchased it from W4RT, and this is the internal module. I have a folder, AE5JU (my call) in the Files section with sound samples I recorded. In each, the module is off, then you will hear a beep as the module is switched on. Later you will hear another beep as the module is switched off again. There is an installation pdf from someone else in the Files section, too.

However if I were to do this again I would spend a few more bucks and use the outboard "black box" from BHI that has its own internal audio amp to drive an external speaker. That way I could use it with other radios.

Overall I am very happy with the noise reduction provided by the BHI DSP module. It works even better than the mp3 sound samples on the BHI site. Listen to my sound samples. I usually set it to Level 2 or Level 3.

Paul
AE5JU

From: Michael Riggs
Topic: 25333 Message: 25389

If you travel with a laptop, get HAM Radio Deluxe and the 897.

With a CAT interface you'll get a way more flexible interface, and
leave $400 in your pocket.

Download it and check it out. It has a demo.

25390. Mobile setups for the FT897

Yahoo group: FT897 (2009)
Date: 2009-03-16 03:30:22 UTC
From: Jack Hamm
Topic: 25390 Message: 25390

Hi All,
I have an FT897 with AT897 on the side. I've recently changed housing arrangements and I think an antenna is a little unlikely. I was thinking of going mobile with my 897. I have a 2007 Toyota Matrix (manual, so there is little center console). Anyone mounted the 897 mobile and have suggestions for placements or any pointers on the rig that might make it easier for mobile/stationary use?

Cheers and 73,
Jack, WA1CFS

Hi,

Save yourself a bunch of effort with FTbasicMMO. This is a simple software program that makes FT-897 memory managemeny a breeze. If you have the CAT cable and a computer it may well be the best $15 you can spend.

Over the weekend I exported the VHF frequencies, offsets, etc from ny Icom V8000. With a little programming I converted the CSV file I exported from the V8000 to an input file that FTbasicMMO would accept.

Loading about 75 frequencies took about 3 hours, programming and learning included.

If all you need to do is make some changes toe your existing stored frequencies, FTbasicMMO will download the current data from your radio. You can then make changes i a spreadsheet-like format and upload the revised file to the radio.

Nice,clean, neat product.

If the setup is what I think it is (that is, the shift lever is on the dash, not the transmission console) it's a piece of cake. I will send you info offline. I have done an installatio of the 897 in a Totoya Prius, and I think the same concept will work for you. I'm writing it up for Bruce Krell's FT-897 web site -- which, by the way, is going to be a great resource for 897 owners!

25393. antenna

Yahoo group: FT897 (2009)
Date: 2009-03-17 23:34:47 UTC
From: dave.stockton@yahoo.com
Topic: 3439 Message: 25393

Hi all
I have a 30ft colinear 2m 70cm at the end of my garden on a 20ft pole. Can I use this to fix either the end of a long wire to or a G5RV without affecting the performance of the vhf uhf antenna. I was thinking of attaching the wire to the house then across to the top of the colinear then down to about a ft from the ground to a dogbone.
Hope this makes sense?

Attach it to the POLE, not the antenna! Attaching to the top of the ANTENNA, is very likely to detune it, AND damage it, as the antenna is not designed to support other items!--73, KC3VO-Bob Curry

Hi George,

I own both radios. The 950 is a great radio, the 897 is a good radio too, but in my opinion the vhf side leaves a little to be desired. If you can afford it, go with the 950. You won't be disapointed. The Receiver on the 950 is leaps and bounds ahead of the 897.

Best of Luck

25396. RE: [FT897] Buy FT-897 vs FT-950

Yahoo group: FT897 (2009)
Date: 2009-03-18 03:07:23 UTC
From: Bruce Krell
Topic: 25333 Message: 25396

Tom,

In what ways is the 950 receiver leaps and bounds above the 897D?
Does it have better selectivity in the IF Bandpass Filter, for instance?
How much better? What are the comparative selectivity figures?

What other ways do they differ?

Bruce

Subject: Re: [FT897] Buy FT-897 vs FT-950

Hi George,

I own both radios. The 950 is a great radio, the 897 is a good
radio too, but in my opinion the vhf side leaves a little to be
desired. If you can afford it, go with the 950. You won't be
disapointed. The Receiver on the 950 is leaps and bounds ahead of the
897.

Best of Luck

Tom de KD8DHH

Dave, It is not a good idea to attach the wire or G5RV to the top of your colinear. I suspect that it will create problems for you on 2m/70cm. It would be better to distance the wire from the colinear by using something like strong nylon fishing line and an insulator. Make the nylon line at least 6' long. Then you can drop the remaining wire vertically to your dogbone. I am not sure, though, about the physical strength of the colinear with a sideways pull especially when it gets windy. Personally, I am not a fan of the G5RV but at least it is a balanced antenna unlike the longwire which may give you problems on the TVI front.

Dave,

On the G5RV you need to make sure the feedline is standing off from any tower you may use by at least 4-6 inches or you will get some pretty high SWR across several of the bands.

None of the write ups on the G5RV type antenna specify that you must keep the antenna feed line vertical for the full length. A few ay it SHOULD run vertical for at least 20 feet, and then be taken to a support where the co-ax can be attached. Some also say full size [80M] G5RV should be at least 30 ft. high... so the feeder could not all be vertical.
None of the sites I have read up on say "you can run the feeder parallel to the mast at 6 inches"
What is mentioned several places says " keep the feeder away at least 6 inches from large pieces of metal" ...[metal guttering] That does not mean "run it down the mast at 6 inches"
My by the book, home brew G5RV antenna is at 25 ft, in a dog leg, to two very good neighbours houses, and the feeder is on a rope stand off from my chimney, running almost horizontal for its length, and taken down the wall at the gable end,in H100 co-ax, and into the shack. as well as not being flat top,,, it is average 15 degrees inverted V, along with the dog leg effect. It works better than a lot of factory built antenna, with PL259 Plug attached selling for $100. + I would love to be in a position to use home brew open wire feeder,,, but just not possible at my QTH.... You use what you have available !!! Be careful you understand the wording which has been "edited" several times over the years on differing web pages. Every QTH is different, so what is good for me, might be wicked at yours... Peter EI4HX _._

25402. Question about the FP-30 Power supply.

Yahoo group: FT897 (2009)
Date: 2009-03-19 06:35:40 UTC
From: Eric Champine
Topic: 25402 Message: 25402

Hi all. I have the 897D and have decided to make it my base station. I just got the 817 for portable use and love it. Anyhow back to my question. I now have a Astron SS-30M that works very nice but after a short amount of time talking the fan turns on to cool the Astron power supply down. I have looked at pictures of the FP-30 and it doesn't look all that big. What I want to know is does the FP-30 cool down well and is the fan loud? How do you all like the FP-30 power supply?
My goal is to consolidate space in my shack and I thought this would be a good start.
I have looked at eham.net and all the reviews are a bit old and I wanted to get a more up to date answer from people who use them.
THanks for your time and 73s.

Same here. Indeed, I don't understand why 'desktop' radios don't come with internal PSUs as standard these days. The FT-897 I can understand being a flexible format and does have a dedicated optional integrated PSU but anything larger - FT-450, FT-900, FT-2000D etc? What proportion of those are going to be vehicle mounted or used in the field? Obviously some, but a large enough proportion to force us all to have another ugly mismatched box and more wires?

In reply to the original question, the FP-30 doesn't have an internal fan and it runs cool.
Some of the original FP-30's had bad noise problems but that problem was easily cured by
the use of small sized capacitors across the +ve and -VE output terminals to ground.
Actually they were soldered across the large internal capacitors to ground.
The FP-30 does not have a grounded negative .

25410. FT-30 Power Supply

Yahoo group: FT897 (2009)
Date: 2009-03-19 11:54:39 UTC
From: Carl Wulfestieg
Topic: 25410 Message: 25410

Eric-
First, the FT-30 internal power supply is fine - I've had mine for five years - no problems, no excess heat, no noise. Just remember, when you turn the transceiver on, first turn on the power supply (switch on the rear of the power supply) {Note: You can find the switch by "feel" once you learn where it is}, then turn on the transceiver (switch on the front of the transceiver). Then, when you turn the transceiver off, first turn off the transceiver, then turn off the power supply.

You didn't ask about this but I'll mention it anyway. Check out the FT-Meter. I have one and it's the best $45 I ever spent. (radio wise) It is an analog meter designed especially for the FT-897. Takes all the guesswork out of trying to understand the built-in digital meter.

Go to: http://www.w4rt.com

It is illuminated without using a light bulb or Power Module. It plugs into the jack on the bottom of the FT-897/D, 2.5" from the right edge, near the front. You set what you want the meter to read by using Menu 60 (when receiving) and Menu 61 (when transmitting).

They can sell the rig for $100 less if they don't include the power
supply. It gives them an edge of any company that includes the power supply

I have an FT897d and I like it right well, however,it has something like 99 different menus to deal with. While it is a great portable rig, I don't understand why anyone would have three of them instead of getting a regular base radio and keeping the 897 as a portable. However, everyone has their own way of looking at things and I can respect that.

I think that is a good choice. I am using the Yaesu fp 1030 power
supply and I like it right well. I also bought a set of batteries from

http://www.batteryspace.com/index.asp?PageAction=VIEWPROD&ProdID=2205&SSAID=204502

for about $70 but haven't had a chance to use it.

The FT-Meter is great. I have two FT-897Ds, one with the AT-897 tuner and one without. The second radio uses the LDG Z-100 tuner. I have the FT-Meter connected to the one with the tuner and am going to get another meter for the other radio. It's become a "must-have" accessory.

its an anologue version of whatever you want to monitor
UK cost approx £42.
built mine via the files here for a fraction of the cost (backround from file, 1mA meter from e bay, box from maplins cable/connector fron junk box)

Thanks

Hi Eric,

I will add my thumbs up for the FP-30B internal supply. It runs cool and quiet and has been trouble-free for the 4 years I have used it. As others have mentioned, as long as you stay with the "B" version you should not have any issues with RF noise. It makes a very neat little HF through UHF "station in a lunchbox" sized package.

I agree with everyone on the FP-30B internal supply. I have a very limited space in my office/ham shack and the stacked unit of radio and power supply makes it so much easier. Also I have had no problems with heat or noise at all.

The FT meter is independent of the rig's screen. You can have SWR on the transmit side of the meter and show power out on the rig's screen. It a lot easier to read the SWR on the FT meter than on the rig's screen.

25422. Re: Question about the FP-30 Power supply.

Yahoo group: FT897 (2009)
Date: 2009-03-19 20:25:38 UTC
From: Eric Champine
Topic: 25402 Message: 25422

Hey all.
Thanks for all the responses. At first I was going to use the 897D as a portable rig and that is why I had the external Astron power supply. I was thinking that I could put the batteries in it just in case there was a power outage or I wanted to go portable but I have a very good HT (Yaesu VX-7R) and now I just got the Yaesu FT-817ND. Both can be used for portable use now so I don't have to unhook all the wires in my shack and upset everything. I have got very use to it as my base rig and I want to keep it that way now. Putting in the internal power supply (FP-30b) is going to clean up wires and space in my shack so I can make room for other stuff. I guess my biggest worries was the heat. I use the rig allot and I didn't want the heat to effect the radio. From all the replies I now know that heat will not be a problem and I thank you all.
As far as the FT-Meter goes, I love the thing. I kind of wish they would come up with some sort of tap that would go in between the power supply end of the plug-in and the radio end of the plug so you could use the light on the FT-Meter. Some day I may try to make one but hope some one else with better knowledge does it first so I don't have to take any risks with my rig.
Next I want to get the LDG AT-897 autotuner. IMO this is an awesome rig and I am very happy with it.
Once again thanks all for the replies. 73s

Eric

From: Tom
Topic: 25423 Message: 25423

OK, I am a bit confused about how to set the display bar graph on the 897D to read for SWR. I might be suffering from owner's "manual overload", or maybe I'm just too dumb to understand, but is it simply a matter of setting the option through the main menu...or is there more to it? Having read the manual a few times it seems that there is a menu choice to be set as well as an additional setting you have to make with the "A" "B" "C" items on the bottom of the display as well. I might be wrong about this, however.(?)
Also...once you have the bar graph set to display SWR, how do you interpret what the SWR reading is as displayed? There doesn't seem to be anything in the user's manual that tells you how to read / interpret the bar graph...? (i.e. 1 bar = 1.1swr, etc?)
My apologies if this question seems pretty dumb. Like I said, I just might be suffering from "manual overload!" :)
Thanks in advance for the replies!!

>
> de KB4MTO / Hank

Put me down as another with the FP-30 (runs cool, no noise problems), the FT Meter (MUCH easier to read), and LDG AT-897.

The LDG tuner tunes up almost anything. It isn't able to tune my 75/40/20 meter multidipole on 160 meters, but then, I would not expect it to.

This all makes for a very compact package. I certainly like it.

Tom,

Just looked at the book and the way you set up the bar graph for the SWR reading is as follow:

Press the F button for a very short period until the MF indicator comes up on the left lower corner of the bar graph. Then you turn the mem/VFO knob until the MTR comes up on the graph. This will be MFi on the left side of the graph. Then you press the A button until the desired function appears above the B button. Then you press the F button for a second to safe the sitting.

I will second the LDG A-897 autotuner. I bought an FC-30 with my 897d, and it works quite well with an antenna that is close to resonance, but not too well with an antenna that is too far out of tune. The LDG A-897 autotuner is much more versatile. At times I wish I had gone with the LDG AT-1000 Pro.

i like the disciminator meter (only available on the external output (dunno why)) to tune the fm signals in & use it for:

the newbies dunno the standard freqs for simplex and land on oddballs like 146.525

sometimes ppl are 5kc off cause they left their 5kc button on

sometimes radios drift off & you can alert ppl to this & even line-'em-back-up over the air

I got the AT0200 PRO and I'm happy with it because I can use it on
other radios too.

From: Richard Head, KDØGDV
Topic: 25402 Message: 25433

If you're going to use the 897 as a base (as I do), you might consider the Samlex 1223. It's half the price of the FP30 and the fan never runs--at least it never has in my shack. Totally silent. I'm all about efficiency, silence, and low price--and the Samlex meets all three criteria.

I think it's all about how you plan to use the 897 - I agree with Richard, if you plan to use it as a base station, it makes more sense to get an external power supply for the reasons he stated (I prefer Astron, but - again -that's just preference on my part).

I do use the FP-30 power supply and it works for me because I use the 897d portable - my main rig is a Pro III and it's connected to an Astron power supply.

So, for my use, the idea is of the 897 being a grab and go station to only operate portable from cabins and even the occasional hotel room. Having the power supply built in is a real advantage for me under those circumstances. But sounds as if that isn't your planned use and - like I said - I agree with Richard's e-mail for your use.

You set it with the multi-function display. Read your manual and it will tell you. To get to it you press and release the "F" or "Function" button.

Subject: [FT897] OK...I'm a bit confused. Can anyone explain...

OK, I am a bit confused about how to set the display bar graph on the 897D to read for SWR. I might be suffering from owner's "manual overload", or maybe I'm just too dumb to understand, but is it simply a matter of setting the option through the main menu...or is there more to it? Having read the manual a few times it seems that there is a menu choice to be set as well as an additional setting you have to make with the "A" "B" "C" items on the bottom of the display as well. I might be wrong about this, however.(?)
Also...once you have the bar graph set to display SWR, how do you interpret what the SWR reading is as displayed? There doesn't seem to be anything in the user's manual that tells you how to read / interpret the bar graph...? (i.e. 1 bar = 1.1swr, etc?)
My apologies if this question seems pretty dumb. Like I said, I just might be suffering from "manual overload!" :)
Thanks in advance for the replies!!

for us guys with external power supplies...stuff 'em under the desktop somewhere (add a shelf)

it's cooler for the supply closer to the floor

you'll enjoy the extra space on top of the desk

the wires'll be off the back of the desk

the fan noise will be less under the desk

may protect from dust/smoke/pop/coffee/antenna falling across the contacts

? If you anticipate a GROWING ham station, and continuing interest, you might do as I did, get a 50 amp adjustable?ASTRON linear power supply, with built-in metering. This supply is very quiet, as it has NO FANS, and being a linear supply, it is also R.F. quiet!? The ability to set a desired voltage and/or maximum amperage output is convenient when servicing, building?or adjusting equipment, or charging batteries. This supply also allows for the simultaneous operation of an amplifier or additional radio(s). --Often, with a radio such as the FT-897, one may desire to add an amplifier for operation on VHF/UHF, and having an extra 25 to 35 amperes available to power the amp is nice! I have the YAESU batteries installed inside my FT-897, and power it from the ASTRON 50 amp. supply at home.73, KC3VO,Bob Curry

Just one thing - putting any device on the floor actually means more dust in it, not less.

That's because dust is heavier than air and tends to settle toward the floor. For instance, when a desktop computer is placed on the floor, the circulating air from the exhaust system deposits dust really fast on the motherboard.

I doubt that it would be a serious problem and am not arguing against placing the power supply on the floor but since the note I'm responding to suggested there would be less dust I thought it wise to at least address that.

Thanks for the help figuring out how to set the SWR meter! It seems as though your explanations were a whole let easier to understand than the 897 user manual was! :) I have it set up now.
Now that I have it set I notice that I am getting anywhere from a 2.1 to a 3.1 (yikes!) SWR reading across the 20 meter band. I'm using a Par Electronics 20 meter end fed antenna. The feed end with the "matchbox" transformer is located about ten feet up BUT under the eaves of my roof BUT only (about) two feet from both my aluminum gutter and my vinyl siding. The rest of the antenna is strung up about twenty five feet through some trees. The close proximity to the gutter and siding MIGHT be the problem BUT it has only started getting higher in the past few days, If the placement of the antenna close to the siding/gutter was an issue, you would think it would have shown up immediately. (Originally I had between a 1.2 and 1.5 throughout the band. I was using a friends watt meter on loan up until about a week ago.) Any ideas?

Hi all.
I do have an external power supply. It is an Astron SS-30M. It is placed in the lower part of my computer desk but space is of a premium. If I was to be able to get rid of the external power supply and be able to add the FP-30 to my radio it would get rid of some wires, that would be a plus and and free up some space so I don't have such a cramped working area. The FP-30 is going to make an ideal setup for me. I may not be taking it places but the hole rig is small and does many thing and that is what I need at this time for the space I have to work with. The biggest thing I needed to know before I purchased the FP-30 is if it stays cool. You all answered my question and made me feel better about the purchase. This pay day I'm going to order one from Ham City unless I find one cheeper from someplace else. Thanks for everyones input. 73s.

Re:20 meter end-fed SWR--Trees are now GROWING!? The tree is likely to influence your changing SWR, as R.F. characteristics of the tree change as it grows, or becomes wet vs dry. Anything large, that is very near (within 1/4 wavelength) of an antenna is likely to have noticable effect. Often, a tree will LOWER the resonant frequency, so you may see lessSWR at 14.00 than at 14.300----if so, either trim the tree/relocate the antenna, or shorten the antenna to raise the frequency.? (lengthening the antenna will lower its frequency)--try changing the length about 6 inches. 73, KC3VO, Bob Curry

Eric, I had an old Toshiba computer a/c adapter for a laptop I no longer had. The plug was exactly right to plut into either the FT meter for backlighting or the LDG antenna switch. However, those require 12-14 volts dc, and the a/c adapter puts out 19 vdc.

I spliced in a 7812 voltage regulator chip (TO-220 case), insulated with some heat shrink tubing, and voila!

hi,

does anyone have this review? can you post it?
i found a similar for ft-857d and mensions the article on radcom for full review of ft-897

thank you.

I own an 897D, and not a 950, but I did read last night in one of the amateur radio catalogs that the 950 stability is +- 1PPM, and the 897D which has TCXO standard is +- .5 PPM. The 857D is +- 1PPM w/o the TCXO. So in the standard config, it would seem that the 897D is more stable than the 950. Like I said, I don't own a 950, so I don't know anything about it other than what I read. Although I do love my 897D. I enjoy camping and outdoor activities, and this is the radio for me. I also have a large FT-101EX station with many of the original accesories, but still prefer the 897. FWIW.

> >
> > Larry
> >

Quite simple really...Price of the PSU , Output Power and
potential Heat generated within the radio.
I use an external 40 amp PSU to power other equipment
aswell and was cheaper than the yaesu PSU.
So everyone has a reason to use the 897 in diffenrent configs.
Mine need was, a quality all round radio with a good beefy PSU
and so i have a miss match of equipment cases,but i do love
the radio...

Hello Eric,

I just checked HRO and they have the FP-30 supply for 174.95 as of this morning. Hope this Helps.I just bought an FT-897D, AT-897, FT-Meter and the CT-62 cable. I will probably buy the FP-30 myself. I already have a Astron PS that I was using on my TM-742A tri-bander so I will probably use it to start with on the 897D.

>
> I know there is quite a difference but here is my dilemma. The 897D has VHF and is small to take with me when I travel to VA. However, I am not sure I am a fan of all the menus to get things done. The 950 has less menus and more controls, better receiver, but no VHF and is larger to haul. So, if you have had experience with both what do you suggest. I keep thinking I have the HT for VHF and can always go mobile.
>
> Thanks for your thoughts,
> George
> AK4OF
>

I just purchased a FT897D as my first HF rig. I also considered the IC706MkIIG, FT950 and the IC-7000, but decided to go with the FT897D for the following reasons:
- I can add internal batteries to the 897 making it portable for camping and available for use in emergency situations. I wanted portable but didn't really need mobile.
- I like having the VHF/UHF in one radio rather than purchasing a separate VHF/UHF rig. Less stuff to grab in case of an emergency. Also you can work all modes on VHF/UHF with the 8x7 series.
- I can add mechanical filters once I feel I'm to the point where I need them.
- The 897 can work as a mobile, if you have the passenger seat to spare.
- The argument that the 897 has a small display is irrevelent if you use HamRadioDeluxe.

Other pluses:
- The CAT interface along with HamRadioDeluxe is a must have addon. Completely user configurable and eliminates the need to search through menus. Add a RigBlaster or something similar and your good to go with the digital modes.
- If you plan on using an antenna tuner and the CAT port, the LDG-897 tuner allows both.

I'm new to this so I haven't done much with HF yet other than listen. I've been on the air on VHF and UHF with the 897 using the FM and SSB modes and have gotten good signal and readability reports. So I'm happy with the 897 on VHF/UHF.
The portability of the radio was also important in case our ARES group has to deploy.

So basically I'm very pleased with the 897 as my one and only DC to daylight radio. I also think it makes a good rig for a first time buyer thats not afraid of the menu systems necessary on smaller radios.

Hello All -
I just ordered an FT-897D and FP-30B from Gigaparts today and expect them on Monday. They are offering an extra discount which was irresistible. I have used the FT-897D and FP-30B supply before and found it an amazing and versatile rig that does everything well. The improved internal supply never got hot and I detected no RFI of any kind from it. The whole package, with that robust handle, makes for a great portable rig and a fine home station as well, especially when you have limited space.
I am also in agreement about getting the FT meter and am shopping around for the best price. I also had one before and liked it very much. It is good to be able to monitor power output and SWR at the same time or go to other scales using the menu. I also like that big analog dial and needle. An excellent accessory!

73,
Bruce K6RQR/9

>
> Hey all.
> Thanks for all the responses. At first I was going to use the 897D as a portable rig and that is why I had the external Astron power supply. I was thinking that I could put the batteries in it just in case there was a power outage or I wanted to go portable but I have a very good HT (Yaesu VX-7R) and now I just got the Yaesu FT-817ND. Both can be used for portable use now so I don't have to unhook all the wires in my shack and upset everything. I have got very use to it as my base rig and I want to keep it that way now. Putting in the internal power supply (FP-30b) is going to clean up wires and space in my shack so I can make room for other stuff. I guess my biggest worries was the heat. I use the rig allot and I didn't want the heat to effect the radio. From all the replies I now know that heat will not be a problem and I thank you all.
> As far as the FT-Meter goes, I love the thing. I kind of wish they would come up with some sort of tap that would go in between the power supply end of the plug-in and the radio end of the plug so you could use the light on the FT-Meter. Some day I may try to make one but hope some one else with better knowledge does it first so I don't have to take any risks with my rig.
> Next I want to get the LDG AT-897 autotuner. IMO this is an awesome rig and I am very happy with it.

25452. Portable work with the FT-897D (GPS and locatorsquares)

Yahoo group: FT897 (2009)

From: sm5snf
Topic: 25452 Message: 25452

Hi,
I am to use the FT-897D as a portable rig, in combination with a Pansonic toughbook pc. I wonder if anyone has heard of a locatorsquare program for pc, which one can attach a GPS unit to. It would be nice to have an instant readout of the locator square instead of "translating" it yourself.

25453. Strange intermittent problem with receive stopping and fans coming on

Yahoo group: FT897 (2009)
Date: 2009-03-20 17:04:48 UTC
From: m0rjc
Topic: 25453 Message: 25453

My 897 has developed a problem. Depending on which band it is tuned to (the set of bands this occurs in varying from time to time) it will run its fans at full speed and seemingly switch off its receiver circuitry. A strong local broadcast station on FM will be just listenable with other national stations not received. On the HF bands switching between antenna and dummy load makes no audible difference in received audio - as if it's not connected. Pressing the Band Up or Down keys to change band may move to a band that works. Moving back tends to bring back the problem, though this varies.

One thing I want to rule out (or rule in) is the CAT cable. I'm using a CAT cable that is sold as designed for this radio. The open circuit voltage on the data pin was 5V, so it looks like it uses TTL levels. I've not looked at any further tests, for example looking for any evidence of a level shifting circuit that would raise it to 13.8 given the power out from the radio for example, or looked at voltage levels in use.

It looks from posts here as if TTL level is correct for this radio. The CAT interface also worked successfully transferring data each way. The radio is still faulty even with the CAT cable unplugged, even after a Power->Home Key reset.

Thanks

- Richard MØRJC

25454. CAT s/w control

Yahoo group: FT897 (2009)

From: Howard Z.
Topic: 25454 Message: 25454

Hi everyone,

Earlier this year I wrote software to control the Palstar AT-AUTO tuner. Then I added some HRD style radio support for a few ICOM radio models. Then I added support for the LDG AT200PC tuner.

Recently someone in the LDG forum asked for FT897 support. I added some limited support, but now he doesn't seem to want to test it.

I am hoping someone here will be willing to test it and provide feedback. It may take many cycles of emailing me about what is or is not working including debug output, and then my making changes to the software.

The Yaesu FT897 manual is not very clear, and the odds are my s/w does not work as currently written.

Also for now it is coded for 9600 baud only.

Also, unless you only own 1 radio, you already have a power supply, why add the cost of a power supply and the added weight to every radio.

Realizing that eventually I'll have multiple radios in my shack, an external PS seems to be the best choice.
I use a Samlux SEC-1235M that has enough capacity to connect multiple radios (such as my mobile when I bring it in) at the same time.

I'm also reserving the bay of my 897 for the batteries for portable/emergency use once I can afford them.

And considering emergency use. I believe all ARES/RACES groups have standardized on anderson connectors. So it's best to have your radios setup to use them so you can have easy access to other operators power sources in case of an emergency. A neat solution is to run your PS into a Rigrunner and then just plug your radios into the rigrunner.

McMaster Carr (www.McMaster.com)

carries every imaginable threaded product on the market. My radio and I are not at home until tomorrow evening, but when I get home I can pull one of the screws and measure it, if nobody beats me to it. ;-)

another excellent source of threaded products is www.boltdepot.com

both should have what you need; I would order from whomever is cheapest, counting shipping.

Yes, McMaster-Carr sells almost every screw known to man - on some items, they'll even "break the box" so you can buy a few rather than a box of 100. However, there is a source closer - try Lowe's in their hardware section - they have metric screws.

Now, as to size - I'm going to guess you mean the four little legs on the left side? (the side opposite the handle?)
I'm looking at one now. I can't tell you the metric size because Lowe's is closed now. The thread OD is a little less than 1/8 inch - so it's about the size of a number 4 screw except it's metric. The length is 9/32 inch. It's a pan-head Phillips screw. Now here's the bad news - it looks like it's a "shoulder" screw with a 3/32 shoulder. In other words, the threads stop 3/32 inch from the head. If you want this exact same screw, I'm guessing that Yaesu will be the only source. If you don't want to be perfect, then get four screws that are Pan Head, Phillips, the metric size that's close to number 4 screw, and 9/32 inch long. Someone else may be able to tell you the real metric size. Good luck!

Yes, it probably is a 3mm screw. That would be 0.118 inch which is slightly bigger than a #4 screw. That would mean you're looking for a Pan Head, Philips, M3 x 6mm long. Good Luck!!

I think the problem is that he doesn't have the screws (long story) to use as a comparison - that's why he's asking. ??

What development language do you use? I'd be happy to send you some examples in VB or C it's a pretty straight forward interface. I'd be hesitant to test since if your not sure you understand you could reset the radio.

OK - I'm looking in my McMaster-Carr Catalog. If you need M3 x 6 screws, they have them. I have an old catalog so I can't tell prices.
Maybe you could check with Yaesu to be sure the screw really is a M3 x 6.

Pan Head Phillips
18-8 Stainless Steel (Metric)
M3 x 6
Part No. 92000A116 Box 100

Metric Pan Head Phillips
Zinc-Plated Steel (Metric)
M3 x 6
Part No. 92005A116 Box 100

McMaster-Carr
New York City - Philadelphia Distribution Center
473 Ridge Rd.
Dayton, NJ 08810-0317

(908) 329-3200

Old Catalog - Part Numbers, address, phone numbers could be changed.

Thank you all for the great help, finding out the screw is an M3 X 6mm
really helps.
I will be able to order them now. Oh I did send an email to Yaesu a
couple of days ago and no answer so far.
Thanks again

I can't guarantee that all of them are as good as ours, but ACE Hardware here in my little town has a great selection of metric hardware. They wouldn't even care if you took the radio in to make sure you got the right screws.

Jim,

Thanks! I actually came across that article a few weeks ago. I *am*
getting some RF in the shack... I've found that Apple multi-button
mice are REALLY susceptible to RFI around 80m (the "3rd" button switch
kicks on and off by itself when xmitting.).

The counterpoise is the next easiest thing to try, so I'll keep you
all posted.

From: John Johnson
Topic: 25402 Message: 25477

The edge being a product that doesn't work out of the box versus one that does? If we're smart enough to pass the licence exams we should be smart enough to do simple arithmetic and not fall for that ploy.

Your argument should apply to other devices but looking round me I see a computer with an internal PSU, and likewise a television, a satellite box, a hi-fi system, a clock radio etc. Even stuff with external supplies like the Xbox and the Mac Mini came with a supply and it's in a matching style. Yaesu? Sure, you can have a speaker and DMU to match your FT-2000 or FT-900 but a PSU? Sorry, here's an ugly metal box with screw terminals that will give your partner more ammunition for banishing you from the house.

JJ

They can sell the rig for $100 less if they don't include the power supply. It gives them an edge of any company that includes the power supply

I second that ACE is the place. If you can't find at ACE try

Micro Fasteners - http://microfsterners.com or

RTL Fsterers - www.rtlfsterners.com

for small orders with minimal shipping charges.

Have you used an SWR/Watt meter or an analyzer to check how much you are getting on reverse? Is your antenna store bought or did you make it yourself, did you check it with an analyzer and the connectors? Are your 259s good? Do you have a switch that will cut off your antenna to the radio, if you do is it grounded? Is your radio grounded?

25482. RE: [FT897] Re: Programming Question - Solution

Yahoo group: FT897 (2009)
Date: 2009-03-23 11:51:58 UTC
From: Adam Karsin
Topic: 25385 Message: 25482

Hi everyone,

Well, I solved my issue, just a little harder than I had hoped. I exported the read in an Excel spreadsheet, reorganized and added as I needed then reloaded into the ADMS.

Thanks for the help,

Adam

Topic: 25454 Message: 25485

Hi Mike,

I am using Java and JavaBeans.

I learned long long ago, that nothing works until one tests and repairs it. I have found a willing email-testing-pal for the ICOM 7000 and the Kenwood TS2000. I'm looking to test code I have written for the ICOM 7700 and also the Yaesu FT897.

The code for the FT897 currently only asks for frequency and mode, and can change the frequency and mode. Commands 1, 3, and 7. I am sending each 5 byte command as binary data. This is very different from Kenwood which uses standard ascii characters, and Icom which uses binary and BCD.

The uniqueness of my program is tying together the Auto-Tuner control with the radio-control. People whose auto-tuners do not have a PC control interface may not find my program desirable compared to other choices like Ham Radio Deluxe.

25486. LDG AT-897 Tune probelm

Yahoo group: FT897 (2009)
Date: 2009-03-23 20:12:13 UTC
From: bigiantrike
Topic: 25486 Message: 25486

Hi all
I have a bit of a dilemma on my hands.
Ive just brought an LDG AT-897 and am having horrendous problems with it holding tune on 10 mtrs FM when the power goes over 30 watts .It holds tune for the first transmission and then seems to unlatch and the swr goes sky high
I have tried all the usual for RF in the shack like checking the grounds, torroids on the power and interface cables.
I wouldn't be bothered too much if it wasn't on 10 mtrs as the vertical antenna I use for HF was not one specifically designed for that band.

Any ideas would be greatly appreciated.

Ian

25487. 6 meter oscillations!

Yahoo group: FT897 (2009)
Date: 2009-03-23 15:20:15 UTC
From: n9tax
Topic: 25487 Message: 25487

I have an original 897 and the other day I finally got a 6 meter antenna up and when I key up the radio goes into oscillations on any mode. So I unhooked everything but the antenna and power it went away. I started reconnecting things when I got to the cat cable it came back.
I wrapped the cable on a toroid it went away again. Then I hooked up the keying cable to the z100 tuner to acc port it came back again. I stopped here. I am going to try to opto-isolate the keying cable but this doesnt seem like normal operation. Does anyone have any similar experiences or solutions to this problem I would hate to have to send it in for repair if there is something I could do. Any help would be greatly appreciated.

Thanks,
Joe N9TAX

25488. Problem with CAT (CT-62), LDG AT-897 and Hamradio Deluxe

Yahoo group: FT897 (2009)
Date: 2009-03-24 07:27:38 UTC
From: sm5snf
Topic: 25488 Message: 25488

Hello,
I have an FT-897D with a LDG AT-897 and a CT-62. When I connect the CT-62 from the AT-897 to the pc, running HamRadio Deluxe, I cannot connect. I have tried to connect directly from the radio to the radio with the same result. I then changed menu item 20 to CAT (from tuner) and it works both directly from the radio and from the CAT out on the AT-897. When the radio is set to use Tuner on the CAT-connector, it simply doesn't work. Should it be this way or is it something I have missed when reading the manual?
The tuner works ok when the menu item #20 is set to tuner, so I believe the connector works and also the tuner itself.

Further experimentation and it's looking like the relays may be a problem. On the FM broadcast band anyway it's behaving like the relay contact for receive is not reliable. Switching in and out of that band will produce anything from no signal to tiny signal to full signal.

This doesn't explain the fan - unless that's on a relay too - but maybe could explain the other behaviour.

An interesting place to look for code is the Linux "Hamlib" project. It has a back-end for the 897 which seems to work quite well. Looking at Yaesu's manual and what it does I think there are some minor improvements that can be made. It doesn't read operating mode correctly but Yaesu's manual says that this information is available. It could be easy to change this code to make it work, or even if you don't want to use Hamlib's abstracted front-end do something special with the back-end code.

Hamlib is in C, and looks well written.

Date: 2009-03-24 10:28:45 UTC
From: Philip Zeigler
Topic: 25488 Message: 25491

When using the AT-897 tuner, you do not need to set the FT-897 to tuner mode. It should stay in CAT mode. The AT-897 just uses the CAT port for power and passes through everything on to the CAT port on the tuner.

For HRD to work, the radio must be in CAT mode.

I think the AT-897 will resolve 10:1 SWR mismatch
but not more. Sounds like the SWR of your mismatched
antenna is just too far out of resonance....

I had this happen only once.. when accidentally tried to
TX on 80M into my 20M dipole.

Because the radio itself works from 12v-13.8v dc, and even for desktop use may have to also run from gel type car battery for emergency use during power outages. That is much more efficient that stepping up voltage to 110 vac via battery/inverter and then back down to 12 vdc via power supply.

From: Adam Karsin
Topic: 25496 Message: 25496

Is there a way to do direct entry in VFO mode?

The only buttons that seem to have any purpose are the up/down and button "A"

I'd love to be able to do any or all of the following from the microphone:

choose mem or VFO

direct enter a frequency (vfo) or memory channel

scan on or off

and not sure what other options might be available, but it doesn't see to be any anyway..

thanks,

73,

Adam

Hi Joe,

Some of these radios do exhibit an instability on 6M (and 432, but that is another story).

Mine has a little copper tab added by the factory to make a ground connection to the cover, but that does not seem to help me.

Some folks have prescribed taking off the top/bottom covers and tightening the screws that secure the PCB's to the chassis.

Some have rerouted the coax in their shack.

What has worked for me is to change the antenna cable length by adding a short jumper of coax to it by using a barrel connector. My guess is that it changes the antenna impedance presented to the final amp a little and gets it out of the area of instability.

GL and 73,
Chet, N8RA

Sounds like you may be attempting operation on 6 meters with a Poorly situated antenna! Is the radio indoors, with the antenna outdoors, in the clear, at least 40 feet away from the radio? If the antenna is nearby, VERY high levels of R.F. energy can be induced on all nearby cables! (poor/loose coax connections can also cause this,-I have seen problems caused by connectors having poorly/improperly soldered coax shield connections) Indoor antennas SUCK, especially for transmitting! If everything works great into a dummy load, that is a sure sign of R.F. feedback!--73, KC3VO-Bob Curry

Hi
The MEM/VFO knob on my FT-897D has felt very "wobbly" since I got it.
The other day it just fell off & when I examined it, one of the hooked clips that hold it on had snapped off. It took me ages to fish out the broken piece so I could replace the knob but obviously it isn't going to stay in place long.
Does anyone know where I can get a replacement (without going to Yaesu & needing to take out a mortgage)

Try holding the band up and band down buttons with the radio off, and power it on while holding these buttons. Should show "Relay Cleaning" in the display and you will hear it clicking thru the relays and your fan should come on and go off, it will return back to normal once this is completed.

As previously stated, it could be RF loading up on the external connections and getting into the rig. That situation can be made much worse if the ground paths inside the rig are no longer intact.

I ran into this with my 897D some time back. When I keyed the rig, it went into a full power output oscillation on some unknown frequency, regardless of mode or power setting. The problem first turned up on 6 meters, but later began to show up on HF as well. When I opened the rig up it turned out that the mounting screws for the top and bottom boards had slowly backed out over time, probably due to the numerous thermal cycles. Snugging the boards back down and also snugging down the PA device hardware cured it completely. I found that the mounting screws kept loosening up after 6 months or so. Eventually I inserted lock washers under each screw and that was the end of the problem. I suspect that the normal ground paths were interrupted by the loose fasteners, and tightening the hardware restored them. The rig was much less sensitive to external RF issues when everything inside was seated as it should be and tightened down.

I appreciate all the input guys I am going to check on the screw issue tonight. I had it apart recently and nothing seemed loose. As far as the antenna and feedline the antenna is outside and tuned well
the coax is new rg8 and tested.

Thanks,
DE Joe N9TAX

25505. Re: Problem with CAT (CT-62), LDG AT-897 and Hamradio Deluxe

Yahoo group: FT897 (2009)
Date: 2009-03-24 10:16:15 UTC
From: kbrown1075
Topic: 25488 Message: 25505

Menu Setting 20 should be on CAT when using the AT-897. Power for the AT-897 is taken from the CAT port but is controled from the tune button on the front of the AT-897. This is one of the major advantages of using the AT-897 versus the FC-30, you still have use of your CAT port. The FC-30 tuner gets it's power and control from the CAT port and is controled from the A B C buttons and you loose any other use of the CAT port.

Hope this Helps,

Kirk

> I have an FT-897D with a LDG AT-897 and a CT-62. When I connect the CT-62 from the AT-897 to the pc, running HamRadio Deluxe, I cannot connect. I have tried to connect directly from the radio to the radio with the same result. I then changed menu item 20 to CAT (from tuner) and it works both directly from the radio and from the CAT out on the AT-897. When the radio is set to use Tuner on the CAT-connector, it simply doesn't work. Should it be this way or is it something I have missed when reading the manual?
> The tuner works ok when the menu item #20 is set to tuner, so I believe the connector works and also the tuner itself.

In answer to the response about relay cleaning. First time it didn't - no clicks. After power down for a while it gave 3 clicks.

When switching between 2m and 70cm I normally get a click - which would make memory scan involving both those bands a little worry. That click is sometimes missing.

I wonder if it's what drives the relays?

Thanks

Hi Adam,

I'm not sure about that mic although I think there is one which does have the capabilities, however, there is another option and that is the Millenium QSYer which connects to the CAT interface and allows direct frequency input, mode change, VFO selection.

I have several of them which I built from John Hansen's kit and they are great. I use them with FT897, FT100D & Ft817 and can highly recommend them.

Hi Eric,

I am not familiar with the Millennium, but I do have the Ham Radio Deluxe as well as the ADMS Software. I have been considering adding mobile capabilities to the 897 and was thinking for ease of use while on the go. Sometimes it is a pain if you have 200 channels programmed (I don't, but you never know) and want to get to somewhere in the middle, having to scroll through 100 or so to get where you want.

Thanks for the info, I will check out the Millennium when I have a little time.

73,

Adam

Hi there
Normally I would agree with you but the antenna that I am using is a 10 mtr vertical and that is the band I am having problems with..
It Will tune 40 through to 12 no problem....
After Mutch work with earth rods and toriods I have found that the problem is RF getting in via the power supply...If I work from a 12v car battery the problem is not there..
Question
Are switch mode power supply's More prone to RF infiltration than Liner ones and what is the best way of getting rid of the RF.

Your help is most appreciated...thank you

Ian

It could be that the switching supply is the source of the noise
rather than
being hurt by RF from the antenna. Make sure the connections are
very
good and tight. What kind of PS do you have? I had a lot of
noise from
my Astron SS-30, but found that the connections were loose.
Tightening
them made (most of) the noise go away.

There is an internal clock in the switching PS, and you will get
noise
on harmonics of this clock. If the PS is intended for amateur
radio
use, it should not emit too much RF noise in the ham bands.

There was a review in QST a while back showing the noise
frequency
spectra from different PS's.

Noise can be reduced by adding inductance (toroids) and
capacitance
(capacitor across the radio power connectors). I expect this is
covered
in the ARRL handbook.

The AT897 *is* sensitive to RF on the shield of the feedline,
BTW.
It has a microcontroller inside that runs the relays according to
its
search algorithm. The uC gets confused by too much RF.

73,
Rob

You can buy a CAT cable (under 20 bucks) and hook your radio via a serial port to a PC, download Ham Radio Deluxe (free) and control everything from your pc, I use it and other than using the MIC to key and talk, I do everything from my PC.

Sounds like it could be power issue possibly? What voltage does the display show? This works for both 897's and 857's It should click several times and cycle a couple times, should show "relay cleaning" in the display. I would try running it a couple of times. I do this monthly, of coarse I use my radio several times a week. Your milage may very.

I agree that the AT897 is a bit RF sensitive. I had a problem with mine locking up in XMIT mode on various, but not all, frequencies when feeding a Buxcomm 8010CD folded dipole. Installed a Balun Designs 1113u 1:1 Feedline Isolation Balun between the tuner and my coax switch. No more problems. My Hustler 5-BTV seems to tune a bit faster now too, subjectively.

besides the HRD route or the Millennium, there is an optional Mic, MH-36E8J that has the direct freq entry and different functions. They run anywhere from $50 to $80.

25516. Re: MH-36 Microphone question

Yahoo group: FT897 (2009)
Date: 2009-03-26 03:11:43 UTC
From: Mark Levenite
Topic: 25496 Message: 25516

Adam,

The MH-36E8J microphone only allows for DTMF tones to be generated (like a touch-tone pad). The Yaesu MH-59A8J microphone, on the other hand, does perform direct frequency entry and other remote functions. Not sure what model rig you have but one caveat, though, is that the MH-59A8J microphone will only work 100% with very late-in-production FT-897 units and all FT-897D models. Older FT-897s that have had the firmware upgraded by Yaesu for the newer production units will also have the MH-59A8J work correctly.

If you do have an older FT-897, the MH-59A8J will work with the exception that the DSP menu cannot be accessed via the microphone keypad and the "1" and "D" key functions are reversed (upper left and lower right buttons on keypad). All other functions are, as I recall, usable as designed.

If you have a FT-897D manual there is a section in the back describing the operation of the MH-59A8J; if not, in the "Files" section on the menu to the left of your screen there is a .pdf file of the '59A8J instructions.

Prices are as noted below by Tim, KC0UJM.

Mark and Tim are both right on with their advice. I had mine updated and I think with shipping cost I spent was around $90 and they even tuned it up to factory specs.

If you decide to send it be sure to list everything you are sending. Filters, batteries etc... be specifc and also list what the problem is and who you talked to at the factory.

It was well worth it to me to send it in and I'm very happy with the service I got.

Is the a general version of ADMS that will work on all Yaesu prodcts?
I have 3 yaesu radios and they all require different version of the ADMS program.

Nope...only the data base is moveable from radio to radio and brand to brand. The programming software is radio/brand specific.

There are a few overlaps, but mostly one program per radio model.

It was showing 14.0V. I'm using an Alinco switching supply rated at 30A. The 897, at the kinds of power levels I run (10W typical) barely makes it work.

Thanks

That's good! Makes me more optimistic.

I talked to their tech support department. They couldn't help on the specific problem but told me that when they repair they repair the board rather than replace. Pros and cons there - more time, more labour, less part cost, dunno if anything else is on its way out. If I send mine in for repair I'd ask them to check the whole thing.

25523. Wobbly VFO

Yahoo group: FT897 (2009)
Date: 2009-03-26 13:02:41 UTC
From: Richard Head, KDØGDV
Topic: 25523 Message: 25523

My new (February purchase) 897 has also had a "wobbly" VFO from the time I took it out of the box. I talked with my retailer about it, but he didn't have much to say. I emailed Yaesu tech support yesterday, after reading Phil - GW1CJJ's report. Here's what Yaesu tech support emailed back (within 24 hours):

Richard:
The wobble you feel is designed into the radio. The reason for the this is that that knob also has a push in feature for changing the frequency by MHz.

I understand the push feature, but the whole knob feels loose, as Phil described originally. I just hope that if it fails, it does so within the warranty period.

Are you talking about the actual VFO (big knob), or the "MEM/VFO CH" (smaller knob, upper right)? The "MEM/VFO CH" knob is the one that pushes in, not the "big knob" VFO. FWIW, on both of my 897s (one D, bought new, and one non-D bought used) both the VFO and the MEM/VFO CH knobs "wobble" a little, not excessively.

Date: 2009-03-26 13:38:37 UTC
From: Richard Drevo
Topic: 25523 Message: 25526

Richard,

Did he mean the "Main VFO Tuning Dial" or the smaller "MEM/VFO CH" knob located to the right of the main VFO tuning dial ??

If he meant the "MEM/VFO CH" knob, then this is correct; i.e. you depress it to change the frequency by MHz. increments, and Yes, Mine is also "wobbly" but works fine.

Hope this helps.

25527. Re: [FT897] Wobbly VFO

Yahoo group: FT897 (2009)
Date: 2009-03-26 13:38:55 UTC
From: Lew Phelps K6LMP
Topic: 25523 Message: 25527

So I guess this means that all FT-897 users are Wobblies!

(Following from Wikipedia)

Wobbly (Sometimes shortened to "Wob") : A nickname of unknown origin for a member of the Industrial Workers of the World. Many believe "wobbly" refers to a tool known as a "wobble saw." One often repeated anecdote has it that a sympathetic Chinese restaurant owner in Vancouver would extend credit to IWW members and, unable to pronounce the "W", would ask if they were a member of the "I Wobble Wobble."[9] Another explanation is that the term was first used pejoratively by San Francisco Socialists around 1913 and adopted by IWWs as a badge of honor.[10] In any case, the nickname has existed since the union's early days and is still used today.

Lew's addition:

I have read from several sources that the term arises from the fact that large numbers of IWW members would board the streetcars to go to demonstrations in NYC. They overloaded the streetcars so badly that the trolleys wobbled. Hence, the name.

OK all U WOBS
We had this topic about a year ago...
At that time my knob did not wobble a lot, and has still only a small wobble [can I get one from the factory] or is there a software up grade for this , in the files section ???
Seriously, I discovered a week ago that my[non wobbly] "MEM-VFO-CH" knob, had lost the facility for the push in, frequency shift.
What happens now is, a little flag pops up on the top of the screen, and the knob, goes into lock !!!
I see nothing in the manual for this.... Have I a non wobbly, FT897D special... ??
How do I get back the push in frequency shift????
Thanks in advance

From: Richard Corfield
Topic: 25528 Message: 25529

There's a setting for what it does when you push it in.

I thought it would be useful to use it to do something like change RF power, only it doesn't give a good interface on my older 897 so I change RF power by holding down the F key and going to the right menu entry. The ability to customise what's on the shortened menu is good, as is that it's in alphabetical order.

Push the knob in again and it will return to normal.

Topic: 25488 Message: 25530

OK, on my 897d with an AT-897 the menu setting 20 is set to tuner, so I thought I'd change the setting to cat and see what happened; nothing. I am not able to change the setting. In the lower left corner of the display the word "SKIP" is displayed. What do you suppose is going on?

Subject: [FT897] Re: Problem with CAT (CT-62), LDG AT-897 and Hamradio Deluxe

Menu Setting 20 should be on CAT when using the AT-897. Power for the AT-897 is taken from the CAT port but is controled from the tune button on the front of the AT-897. This is one of the major advantages of using the AT-897 versus the FC-30, you still have use of your CAT port. The FC-30 tuner gets it's power and control from the CAT port and is controled from the A B C buttons and you loose any other use of the CAT port.

Hope this Helps,

Kirk

I have tried to connect directly from the radio to the radio with the same result. I then changed menu item 20 to CAT (from tuner) and it works both directly from the radio and from the CAT out on the AT-897. When the radio is set to use Tuner on the CAT-connector, it simply doesn't work. Should it be this way or is it something I have missed when reading the manual?

Thanks!
Other than losing a few simple settings, that did the trick. Not only that, but I was able to run Yaesu's programming software and download my frequency memory settings. Now If I need to reset for any reason, I'll be able to do a restore quite simply through the pc.

Not sure why the knob goes into lock but the little flag is telling you that the freq shift will be course, ie: to go from 145.000 to 146.000 will take one click.

Not sure if its the flag or the lock thats the question?

OK all U WOBS
We had this topic about a year ago...
At that time my knob did not wobble a lot, and has still only a small wobble
[can I get one from the factory] or is there a software up grade for this , in
the files section ???
Seriously, I discovered a week ago that my[non wobbly] "MEM-VFO-CH"
knob, had lost the facility for the push in, frequency shift.
What happens now is, a little flag pops up on the top of the screen, and the
knob, goes into lock !!!
I see nothing in the manual for this.... Have I a non wobbly, FT897D special...
??
How do I get back the push in frequency shift????
Thanks in advance

Are you talking about the actual VFO (big knob), or the "MEM/VFO
CH" (smaller knob, upper right)? The "MEM/VFO CH" knob is the one
that pushes in, not the "big knob" VFO. FWIW, on both of my 897s (one
D, bought new, and one non-D bought used) both the VFO and the MEM/VFO CH knobs
"wobble" a little, not excessively.

MENU MODE No•057 [MEM/VFO DIAL MODE]
Function: Selects the function which is engaged when you
press the MEM/VFO CH knob.
Available Values: CW SIDETONE, CW SPEED, MHz/
MEM GRP, MIC GAIN, NB LEVEL, RF POWER/STEP
Default: MHz/MEM GRP

From PAge 57 of manual....

You must set to default!!

I cant see the flag noted in the manual either,
Try that mate and it should change freq

Did you turn the large VFO knob when you were in menu 20? This changes the setting from tuner/cat/linear and then you push the F button to save the change.

OK, on my 897d with an AT-897 the menu setting 20 is set to tuner, so I thought I'd change the setting to cat and see what happened; nothing. I am not able to change the setting. In the lower left corner of the display the word "SKIP" is displayed. What do you suppose is going on?

Subject: [FT897] Re: Problem with CAT (CT-62), LDG AT-897 and Hamradio Deluxe

Menu Setting 20 should be on CAT when using the AT-897. Power for the AT-897 is taken from the CAT port but is controled from the tune button on the front of the AT-897. This is one of the major advantages of using the AT-897 versus the FC-30, you still have use of your CAT port. The FC-30 tuner gets it's power and control from the CAT port and is controled from the A B C buttons and you loose any other use of the CAT port.

Hope this Helps,

Kirk

I have tried to connect directly from the radio to the radio with the same result. I then changed menu item 20 to CAT (from tuner) and it works both directly from the radio and from the CAT out on the AT-897. When the radio is set to use Tuner on the CAT-connector, it simply doesn't work. Should it be this way or is it something I have missed when reading the manual?

Thanks for the suggestion. Claes came up with the fix when he suggested a partial re-set; ([F]+Power on) which did the trick.

Did you turn the large VFO knob when you were in menu 20? This changes the setting from tuner/cat/linear and then you push the F button to save the change.

From: willgord
Topic: 25541 Message: 25541

I want to ground the 897D and appreciate that grounding to a cold water pipe is the preferred approach. No cold water pipe anywhere close to my rig, however.

What I do have is a steam radiator only a few feet from the radio. Can I ground the radio to the steam pipe? Googled the question and several references talked about using a steam radiator and even a baseboard heater to ground a ham rig.

However,before I do anything, I thought I would bounce the question off the group.

Thanks for any help you can offer.

Gordon K2GLW

25542. Re: Yes I do it is pretty stuff, but....

Topic: 25541 Message: 25542

Hi Gordon,

In my second floor station, I ran into the same problem of having no cold water pipe to ground to. I ran a heavy strap from the ground bus on the back of my operating desk to the nearest copper baseboard heater. Fortunately, that run of pipe goes straight down to the basement. Down in the basement I ran a heavy strap from the hot water line my ground was connected to over to the nearest cold water pipe, which effectively tied everything together.

An old time ham in my neighborhood looked it over and suggested that I also run a ground strap to tie the hot water pipes and cold water pipes together at the furnace. His explanation was that otherwise I would be relying on the sediment covered cast iron boiler to guarantee continuity. Seemed like a good idea, so I did that too. This set up has never caused me any problems, and I've never had any RF feedback issues with the upstairs station, even when running a kilowatt.

I'm sure you'll get lots of different thoughts on doing this, but it does work, and when you think about it, they are all part of the same system. If you have copper all the way, it should be fine. If you have older iron pipes, check your pipe junctions with an ohm meter and as long as you have good continuity through all the junctions of your hot water system, all the way back to your electrical service ground, it should work fine. If you find a poorly conducting junction, use appropriate sized ground clamps to run a heavy copper strap across the bad junction.

73,

Rob W1AEX

>
> Adam,
>
> The MH-36E8J microphone only allows for DTMF tones to be generated (like a touch-tone pad). The Yaesu MH-59A8J microphone, on the other hand, does perform direct frequency entry and other remote functions. Not sure what model rig you have but one caveat, though, is that the MH-59A8J microphone will only work 100% with very late-in-production FT-897 units and all FT-897D models. Older FT-897s that have had the firmware upgraded by Yaesu for the newer production units will also have the MH-59A8J work correctly.

(trimmed)

Try as I might, I can't get any info on getting full usage from my MH-36. I have a feeling it can do much more, but it is really no more useful than the MH-31. All I can find is a picture of the mic with labels for the buttons, but that doesn't help. I want some detailed instructions from Yaesu on how to use it, programming options, etc, with the FT-897. The info just isn't in the manual, either 897 or 897D.

I seriously doubt that you have a problem. Since the advent of digital displays, there have always been disagreements as to who is or is not on frequency.

The probability is that your friend is tuned to a frequency which, to him/her, makes your signal sound best to their ears. The difference in this case is that he is listening to you at some insignificant difference in frequency.

Ah for the good old days of analog dials and internal calibration crystals.

You can move the carrier / BFO point on the 897. I don't know if the display on screen takes that into account and displays the actual carrier freqency for CW or something else.

For the old days of analog - I've set up my TenTec kit so that if what comes out of its speaker is at the same pitch my 897 is set up to for Morse then the 897 will receive the TenTec's transmissions at the same pitch.

It could be interesting to try listening in digital mode with the CAT cable and software which shows you the received actual frequency and see where it shows the received Morse to be.

Michael,

I go with the masses, what i mean by that is, call into a round table or net where there are more than 3 people on there, i'm sure they will tell you if you are low on freq, if no bad reports then you should be good to go....

I used to have a FT 890 that the display gave the incorrect frequency, so i just accounted for it, then it started to drift so it was time to let it go, i was moving from UK to USA anyhow.

Yes we are all perfectionists when it comes to Freq but if were all that good there would be no need for a RIT or CLAR......

go with the masses ole man

Read The F******y Manual! Page 68 explains how to set up the memories to track the changing frequency of a satellite as it passes, so from this you can surmise that it's possible.

Other than that, you'll need to know the frequencies of the satellite (google is your friend), suitably directional antenna(e) for the band(s), motorised antenna rotator if you're serious and want more than a minute or two working each pass.

You'll find loads on the web about how to work satellites but that's the prerequisites.

Tom,

Yep, an appendix on page 68 of the Operation Manual has all the details. Having a transceiver that can do band splits is important since you will be for an example so-50 has for it's j-fm repeater is as following: downlink 436.800 and uplink 145.85 which in the split mode allow you to transmit on the uplink and receive on the downlink. Today there is some special event either the international space station or else will be in range for communications. 73 de N2OBS

It is page 69 in the PDF file, but page 68 when you print it out. It is the first thing in the appendix, and it is titled "Setup of memories for low earth orbit LEO rm satellite operation"

APPENDIX
SETUP OF MEMORIES FOR LOW EARTH ORBIT (LEO) FM SATELLITE OPERATION
Although the FT-897D is not capable of ?full duplex? operation
(simultaneous transmission and reception), its flexible
memory system is ideal for configuring a set of memories
for LEO satellite work.
The example below is designed around the popular satellite
UO-14, but the same principles apply to operation using
AO-27, SO-35, and other such satellites.
First, set up a table of the required operating frequencies.
For UO-14, a typical setup table is shown below:
Channel # Rx Freq. Tx Freq. Notes
1 435.080 145.970.0 AOS
2 435.075 145.972.5
3 435.070 145.975.0 Mid Pass
4 435.065 145.977.5
5 435.060 145.980.0 LOS
AOS = Acquisition of Signal (Beginning of Pass)
LOS = Loss of Signal (End of Pass)
The above frequencies are nominal, and the changing frequencies
reflects the Doppler Shift which occurs on such
satellites, which display rapid apparent motion relative to
an earth-based observer. But if we can accommodate a set
of several frequency pairs in our memory system, frequencies
that reflect the frequency relationships encountered
during a typical pass, we will have a good chance of having
our frequencies properly aligned when it is time for making
a QSO.
So we need to store the above frequency matrix into memories.
Note that the receiving frequency and transmitting frequency
are on different bands. Therefore, we will use the
?Split Frequency Memory? storage technique described on
page 42.
First, press the [F] key momentarily, then rotate the MEM/
VFO CH knob to select Multi Function Row ?a? [A/B, A=B,
SPL]. Press the [A](A/B) key, if necessary, to select VFOa.
Now press the BAND(DWN) or BAND(UP) key to select
the 70 cm band. Check the setting of Menu Mode No-004
[AM&FM DIAL]. and set this to ?ENABLE? to allow smaller
frequency increments to be accommodated.
Set the VFOa operating frequency to 435.0800.00 MHz.
Now press the [A](A/B) key in Multi Function Row ?a? to
select VFOb, and set VFOb to 145.970.00 MHz. Again press
the [A](A/B) key to return to VFOa. Be sure that both VFOs
are set to the FM mode, as well.

Press the [F] key momentarily, and rotate the MEM/VFO CH knob one click clockwise to select Multi Function Row ?b? [MW, SKIP, TAG].
Press the [A](MW) key momentarily, then rotate the MEM/VFO CH knob while the memory channel number is blinking; select memory channel M-001, then press and hold in the [A](MW) key until you hear the double beep. We have just stored the first downlink (earth station receiving) frequency into memory.
Press the [F] key momentarily, then rotate the MEM/VFO CH knob one click counter-clockwise to re-select Multi Function Row ?a? [A/B, A=B, SPL]. Press the [A](A/B) key to select VFOb (145.970 MHz).
Again press the [F] key momentarily, and rotate the MEM/VFO CH knob one click clockwise to re-select Multi Function Row ?b? [MW, SKIP, TAG]. Press the [A](MW) key momentarily; the ?M-001? indicator will flash; press and hold in the microphone?s PTT key, and while holding it in press the [A](MW) key until you hear the double beep. You have now stored the uplink (earth station transmitting) frequency into the same memory register as we did previously for the downlink frequency.
It?s now time to store the other frequencies in the matrix. Return to Multi Function Row ?a? [A/B, A=B, SPL], and press the [A](A/B) key to return to VFOa on 435.080.00 MHz. Now rotate the DIAL knob to set the frequency to 435.075.00 MHz. Press the [A](A/B) key again to select VFOb (145.970 MHz), and rotate the DIAL knob to set the frequency to 145.972.50 MHz. Press the [A](A/B) key to return to VFOa on 435.075.00 MHz.
Return to Multi Function ?b? [MW, SKIP, TAG], and repeat the Split Memory storage process, selecting memory channel M-002 this time when initially storing the 435.075 MHz receiving frequency.
Now repeat this entire process three more times, filling memory channels M-003, M-004, and M-005 with the frequencies shown in the chart above.
When it?s time to operate, press the [V/M] key, if necessary, to recall the Memory mode, and rotate the MEM/VFO CH knob to select channel M-001. This will be the first frequency pair to be utilized during the UO-14 window of workability when it rises above your local horizon. The Doppler effect will cause the nominal 435.070 MHz downlink frequency to appear higher to you, so utilize memory channel M-001 when the satellite first rises. A few minutes later, switch to M-002, and at mid-pass switch to M-003. As the satellite recedes, switch to M-004 and then M-005 toward the end of the pass.
The MEM/VFO CH knob recall of these five channels makes Doppler tracking simple; just choose the memory channel

producing the best signal! You have already programmed
an uplink frequency corresponding to the optimum downlink
frequency, so you will not need to try to make difficult
VFO adjustments during the brief satellite passes.
The FM passbands used on LEO satellites are sufficiently
broad that more precise frequency adjustment is not needed.
To aid in channel identification, remember that you can use
Menu Mode No-056 [MEM TAG] to label each satellite
memory (for example, ?UO-14a? ~ ?UO-14e? for the above
five channels).
A complete set of frequencies may be stored for each LEO
satellite you wish to utilize, and once configured, the FT-
897D provides a flexible and easy-to-use earth station capability
for these popular satellites.

If Ham Radio Deluxe can do linked VFOs in split mode then that would seem a good solution. If there's a CAT control system that can predict the shifts needed then it would make things quite easy.

25570. Power cord/connector for FT-897

Yahoo group: FT897 (2009)
Date: 2009-03-31 18:52:44 UTC
From: Jack Hamm
Topic: 25570 Message: 25570

Hi all,
I haven't seen this while searching the group history so I figured I'd ask. I carry my 897 between the car and house and I'm tired of taking the DC cord with me. Does anyone know where and what power cord I should get -or- alternatively, what type of connector does it use and do I need a special crimp tool?

Best 73s,
Jack WA1CFS

I got one from a guy on Ebay. He had other cables listed so I asked him about a custom one (FT897 to powerpole) and it was $20 shipped.

His email is GRYSTCK@...

Very fast service.

Hi Jack,

there are a couple of things you could do.

Firstly you could put a pair of Anderson Powerpoles in the cable about 12" fromthe radio and then use them in your house and in the car to easily swap over the connection. This is what I, and probably many others, have done.

Alternatively, Powerwerx (http://www.powerwerx.com/oem-connectors-filters/) have the various connectors available, as well as the Anderson Powerpoles.

To add to what Eric has said, the plug/socket on the 897 and most other
types of radio are not designed for constant connecting and disconnecting,
the design limit is probably 100 or so insertions.

As Eric said use powerpoles and space them twelve inches or son from the
radio. The powerpoles will have a longer life and are simply and cheaply
replaced.

I would think that the same applies to the FT817 but more so!

Geoff

25578. YAESU to introduce VHF/UHF power amp for QUADRA!

Yahoo group: FT897 (2009)
Date: 2009-04-01 17:38:41 UTC
From: kc3vo@aol.com
Topic: 25578 Message: 25578

Expect to see the NEW YAESU VL-500X2/70 at DAYTON!? This addition to the HF/6 meter QUADRA VL-1000 amplifier will enable you to have 500 watts output on 2 meters and 70 cm, by simply connecting it to your existing QUADRA power supply. The dual band amplifier has selectable drive requirements, of 10 or 50 watts,? dual antenna ports for each band, internal protection from excess voltage, SWR, overtemperature, overcurrent, and overdrive. The basic unit is in a cabinet that matches the VL-1000, and contains space for 2?expansion?modules. Other modules available are: 222-225 mhz @ 500 watts,? 902-928 mhz @ 300 watts,? 1240-1296 mhz @ 100 watts, and 2300-2400 mhz @ 75 watts. These additional modules allow drive levels of 1 or 10 watts. The front panel has a peak-reading R.F. power display, overload reset and indicator, power/standby switch,?receive pre-amp on/off, ?temperature warning indicator, and active band indicator. Estimated pricing is as listed below. (All modules include low-noise pre-amp)
? Dual band amplifiers, with cabinet VL-500X2/70?-includes cables to connect to your VL-1000 power supply $2195.00
? 48 volt 25 ampere power supply(for use wihout VL-1000 QUADRA)
VP-500X2/70----------? $995.00
?? VL-222/500 power module for 500 watts @ 222-225mhz----------$695.00
?? VL-900/300 power module for 300 watts @ 902-928mhz----------$695.00
?? VL-1296/100 power module for 100 watts @ 1240-1296
mhz----------$895.00
?? VL-2304/75 power module for 75 watts @ 2300-2400
mhz----------$995.00
?It is anticipated that "Package Deals" will be offered at Dayton, for a limited time, allowing the purchase of the main 2 meter 70 cm unit with any 3 modules for the special price of $4,120.09----------73, KC3VO-Bob Curry

Assunto: Re: [FT897] Re: Working Satellites with a 897

APPENDIX
SETUP OF MEMORIES FOR LOW EARTH ORBIT (LEO) FM SATELLITE OPERATION
Although the FT-897D is not capable of ☐full duplex☐ operation
(simultaneous transmission and reception), its flexible
memory system is ideal for configuring a set of memories
for LEO satellite work.
The example below is designed around the popular satellite
UO-14, but the same principles apply to operation using
AO-27, SO-35, and other such satellites.
First, set up a table of the required operating frequencies.
For UO-14, a typical setup table is shown below:
Channel # Rx Freq. Tx Freq. Notes
1 435.080 145.970.0 AOS
2 435.075 145.972.5
3 435.070 145.975.0 Mid Pass
4 435.065 145.977.5
5 435.060 145.980.0 LOS
AOS = Acquisition of Signal (Beginning of Pass)
LOS = Loss of Signal (End of Pass)
The above frequencies are nominal, and the changing frequencies
reflects the Doppler Shift which occurs on such
satellites, which display rapid apparent motion relative to
an earth-based observer. But if we can accommodate a set
of several frequency pairs in our memory system, frequencies
that reflect the frequency relationships encountered
during a typical pass, we will have a good chance of having
our frequencies properly aligned when it is time for making
a QSO.

So we need to store the above frequency matrix into memories. Note that the receiving frequency and transmitting frequency are on different bands. Therefore, we will use the ☐Split Frequency Memory☐ storage technique described on page 42.

First, press the [F] key momentarily, then rotate the MEM/VFO CH knob to select Multi Function Row ☐a☐ [A/B, A=B, SPL]. Press the [A](A/B) key, if necessary, to select VFOa.

Now press the BAND(DWN) or BAND(UP) key to select the 70 cm band. Check the setting of Menu Mode No-004 [AM&FM DIAL]. and set this to ☐ENABLE☐ to allow smaller frequency increments to be accommodated.

Set the VFOa operating frequency to 435.0800.00 MHz.

Now press the [A](A/B) key in Multi Function Row ☐a☐ to select VFOb, and set VFOb to 145.970.00 MHz. Again press the [A](A/B) key to return to VFOa. Be sure that both VFOs are set to the FM mode, as well.

Press the [F] key momentarily, and rotate the MEM/VFO CH knob one click clockwise to select Multi Function Row ☐b☐ [MW, SKIP, TAG].

Press the [A](MW) key momentarily, then rotate the MEM/VFO CH knob while the memory channel number is blinking; select memory channel M-001, then press and hold in the [A](MW) key until you hear the double beep. We have just stored the first downlink (earth station receiving) frequency into memory.

Press the [F] key momentarily, then rotate the MEM/VFO CH knob one click counter-clockwise to re-select Multi Function Row ☐a☐ [A/B, A=B, SPL]. Press the [A](A/B) key to select VFOb (145.970 MHz).

Again press the [F] key momentarily, and rotate the MEM/VFO CH knob one click clockwise to re-select Multi Function Row ☐b☐ [MW, SKIP, TAG]. Press the [A](MW) key momentarily; the ☐M-001☐ indicator will flash; press and hold in the microphone☐s PTT key, and while holding it in press the [A](MW) key until you hear the double beep. You have now stored the uplink (earth station transmitting) frequency into the same memory register as we did previously for the downlink frequency.

It☐s now time to store the other frequencies in the matrix. Return to Multi Function Row ☐a☐ [A/B, A=B, SPL], and press the [A](A/B) key to return to VFOa on 435.080.00 MHz. Now rotate the DIAL knob to set the frequency to 435.075.00 MHz. Press the [A](A/B) key again to select VFOb (145.970 MHz), and rotate the DIAL knob to set the frequency to 145.972.50 MHz. Press the [A](A/B) key to return to VFOa on 435.075.00 MHz.

Return to Multi Function ☐b☐ [MW, SKIP, TAG], and repeat the Split Memory storage process, selecting memory channel

M-002 this time when initially storing the 435.075 MHz
receiving frequency.
Now repeat this entire process three more times, filling
memory channels M-003, M-004, and M-005 with the frequencies
shown in the chart above.
When it□s time to operate, press the [V/M] key, if necessary,
to recall the Memory mode, and rotate the MEM/VFO CH
knob to select channel M-001. This will be the first frequency
pair to be utilized during the UO-14 window of
workability when it rises above your local horizon. The
Doppler effect will cause the nominal 435.070 MHz downlink
frequency to appear higher to you, so utilize memory
channel M-001 when the satellite first rises. A few minutes
later, switch to M-002, and at mid-pass switch to M-003.
As the satellite recedes, switch to M-004 and then M-005
toward the end of the pass.
The MEM/VFO CH knob recall of these five channels makes
Doppler tracking simple; just choose the memory channel
producing the best signal! You have already programmed
an uplink frequency corresponding to the optimum downlink
frequency, so you will not need to try to make difficult
VFO adjustments during the brief satellite passes.
The FM passbands used on LEO satellites are sufficiently
broad that more precise frequency adjustment is not needed.
To aid in channel identification, remember that you can use
Menu Mode No-056 [MEM TAG] to label each satellite
memory (for example, □UO-14a□ ~ □UO-14e□ for the above
five channels).
A complete set of frequencies may be stored for each LEO
satellite you wish to utilize, and once configured, the FT-
897D provides a flexible and easy-to-use earth station capability
for these popular satellites.

25582. USB/LSB receive audio passband

Yahoo group: FT897 (2009)
Date: 2009-03-31 23:42:53 UTC
From: morseham
Topic: 25582 Message: 25582

I have noticed that the audio frequency response is not balanced between USB and LSB. USB seems to be normal and LSB seems to be set for a little more high frequency response (not desireable). I can adjust for this by turning on the IF shift. This is a rather clumsy way of adjusting the audio response, however. Is there an internal adjustment to balance the audio response so that when switching between USB & LSB the difference will be un-noticeable?

I don't know off hand, but in the menu (hold down F key) you can set up
different offsets for USB and LSB which can taylor this.

Hi Adam,
Just a simple question ? has your computer told you what port is being used ?????
[recognised]
.... Have you inserted FT897 ??? in the "what rig box"
I had that [simple] problem running digi modes with my HRD software. when starting up.

I do not recall any fuses or breakers inside the radio. Check all connections, as that is most likely the problem. If you are using the Molex connector, disconnect it, then reconnect it. I have found that sometimes the connection isn't as "strong" as is should be. If you have made or "fabricated" a connection (such as adding a crimp-on connector), sometimes that may fail. If you crimped on a connector, check those. Give all connections a good wiggle, then a good "push-in/pull-out" to see if there may be a loose connection. I solder all connectors as crimps can get bad connections or corrode causing headaches as you are experiencing. If all checks ok, you may have a problem internally, however, from what you described it sounds like a connection problem and may not be anything serious.

First menus "Extende Menu". Turn this on. Then you get all menu items.

A nice feature is that you can use the "Skip" button (Button A) to determine whether the menu you're looking at is one of the extended ones or not, so you can customise the non-extended menu. I have (or had before my radio died) quite a limited set of non-extended menu with just the frequently used things on. The symbol top right changes from square to minus depending on whether it's skip or not. I don't remember which way that is.

Recently, I experienced a very similar problem with my 897D. Indeed, it was caused by a loosened power chord connection. I have heard that some other people have experienced a similar problem with their units as well!
Check that main power chord. As recommended previously, disconnect it - reconnect it- be sure you give it a good PUSH in to see that it is, indeed seated fully, - you should be back in business!
Let us know how you make out...!

Hi Jeff,

If it turns out that the problem is not an external issue with connectors or cords, I would suggest that you download the DG2IAQ modification sheet for the 897/857 rigs. There is a section called "FT-897 Won't Power On" that identifies three common failures in the rig (and how to repair them) that will cause this.

http://www.qth.at/dg2iaq/mods.htm

As others have indicated, it is almost always something external that causes these symptoms. In my case, when this did occur, it was a flaky inline fuse holder that no longer had continuity even though the fuse was fine. It turned out to be a bad crimp on the connector inside the fuse holder.

Good luck!

Rob W1AEX

25598. Re: USB/LSB receive audio passband

Yahoo group: FT897 (2009)
Date: 2009-04-02 16:15:19 UTC
From: Rob - W1AEX
Topic: 25582 Message: 25598

Hi Paul,

My 897D had the same issue, which as you stated, could be worked around with the IF shift, but I found it annoying. In my case it turned out that the LSB carrier point was not optimally adjusted in the service menu. I ended up entering the service menu and adjusting item 067 until the LSB and USB carrier points were offset by exactly the same amount. Now with user menu items 015 and 017 set at "0" the audio response in USB is exactly the same as LSB. A great tool for doing this adjustment is the "modify" program located in the files section of this group (posted by VA3CGT). It allows you to save all your stock service menu settings so they can be restored if they are ever corrupted. It also allows you to change service menu settings on the fly. Keep in mind that entering the service menu is not a venture to attempt if you are not absolutely certain you know what you are doing as it is possible to cripple your rig very easily with one blunder. It is the digital equivalent of the "golden screwdriver" syndrome of analog days. It would be wise to read the service manual thoroughly before attempting this.

I can adjust for this by turning on the IF shift. This is a rather clumsy way of adjusting the audio response, however. Is there an internal adjustment to balance the audio response so that when switching between USB & LSB the difference will be un-noticeable?

One other thing that I don't recall seeing mentioned is that the one or more of the pins in the power connector could be not seated all of the way, and "backed out" a little to where it's not making good contact.

Recently, I experienced a very similar problem with my 897D. Indeed, it was caused by a loosened power chord connection. I have heard that some other people have experienced a similar problem with their units as well!
Check that main power chord. As recommended previously, disconnect it - reconnect it- be sure you give it a good PUSH in to see that it is, indeed seated fully, - you should be back in business!
Let us know how you make out...!

>
> I do not recall any fuses or breakers inside the radio. Check all connections, as that is most likely the problem. If you are using the Molex connector, disconnect it, then reconnect it. I have found that sometimes the connection isn't as "strong" as is should be. If you have made or "fabricated" a connection (such as adding a crimp-on connector), sometimes that may fail. If you crimped on a connector, check those. Give all connections a good wiggle, then a good "push-in/pull- out" to see if there may be a loose connection. I solder all connectors as crimps can get bad connections or corrode causing headaches as you are experiencing. If all checks ok, you may have a problem internally, however, from what you described it sounds like a connection problem and may not be anything serious.

25602. Buying FT-897D: AES Superfest vs. Hamvention?

Yahoo group: FT897 (2009)
Date: 2009-04-02 12:47:47 UTC
From: Steve Twigg
Topic: 25602 Message: 25602

Hi All!
Starting tomorrow AES in Milwaukee is having their "Superfest." Since I live within a 1-1/2 hour drive I'm going. On the other hand I'm also attending Hamvention. I have no experience witheither event.

AES's latest advertised price is $769 foe the 897D. (They're not giving any clues if there'll be any "specials") My question then is: If I waited until Dayton, might I get a better deal?

Thanks!
W9SWT

You need to go to menu 1 and enable EXT MENU first to get the extended menus displayed.

I just went through the same process myself.

For some reason, I do not have a menu 015 and 017. When I access the menus, and go through them, it jumps from menu 014 to 022. Why would that be?

25604. LDG AT-897

Yahoo group: FT897 (2009)
Date: 2009-04-03 02:20:25 UTC
From: k4lmp
Topic: 4753 Message: 25604

This is for the people who use the AT-897 Tuner. I have an FC-30 that I like, it does what I want. I purchased an AT-897 tuner because of the extra CAT port on the back. When I tune with the LDG tuner, it "clacks" exactly like the FC-30. I thought the LDG tuner was quiet. Also, if the tuner doesn't have a frequency in memory, the SWR will climb way up and the "Hi SWR" icon displays on the radio. The tuner will tune down, but I don't know if it is normal for all of the above or not. I don't want to damage the finals on my new 897. One other thing, when I tune, or transmit, my dehumidifier on the other side of the room will turn on, then off when I stop transmitting, or when the tuner turns the transmit off. I assume RF is getting into the dehumidifer, but, it did not do this with the FC-30. Let me know what you think. Thanks. Jeff K4LMP

25605. Connection of the FC-30 Antenna tuner and the CAT cable for HRD

Yahoo group: FT897 (2009)
Date: 2009-04-02 16:45:26 UTC
From: Donald Dubuque
Topic: 25605 Message: 25605

I would like to know if the antenna tuner data cable needs to be installed when ever you TX on the radio. If so how does one keep HRD connected to the radio? They both share the same connection point on the radio.

Thank you Rob. You are on target with the issue. Everyone else was pointing at a frequency offset issue which this is not. It is an audio passband issue and is in the IF portion of the receiver and related to the IF shift.... I will give your suggestion some thought and see if that works for me...

Again, Rob, many thanks.

Steven,
You may want to try Eham, QTH or QRZ.com for a deal.
I purchased several rigs, etc. from one or the other
on-line forums and have always had good deals. Most
of the sellers have phone numbers and you can check
with them for particulars.
My last was a mint FT-897D with AT-897 in like new
condition for $600. I've had it for about 6 months
and it has always worked(s) well along with the tuner.
Just a suggestion, as I know, new with warranty, is
attractive for many of us and you can also get good
deals from the distributors at times.
So far, all my purchases here at the three mentioned
forums have been excellent deals, tax free and less than most.
I'm only 30 miles from AES and I like to go there for
parts and look at the new rigs and they have an enticing
array of equipment.
Good luck and good hunting,
Bill

I have rarely seen sale prices better than those you find at Dayton. In fact, I'm not sure I've ever seen sale prices better than at Dayton, unless it was something like a closeout price offered subsequently. I would bet you would be wise to do your shopping at Dayton. I may be wrong, but I suspect that the current sluggish economy might make this a particularly good year for deals at Dayton.

Paul,

Menus 015 and 017 are not frequency offsets even though it is read in Hz. It is how much the IF passband is shifted in Hz. I would check these settings first before messing with the factory settings.

Sure does. But, you have to make sure that is selected. You do that by going to the buttons on the front panel; Momentarily press the [F] key. Watch the display at the bottom left just above the function keys and the display for them. Rotate the Mem/VFO key till the display shows MFi. You will then notice the label for the multi function keys changed to (A) MTR, (B) PWR, (C) DISP. The Multi function B button is usually defaulted to PWR. But now you can toggle it from PWR to MOD to SWR to ALC back to PWR (it cycles).

It is also ported out to the jack on the bottom front of the radio (depending on your settings for sub-menu number 61). I plug my FT meter into it and use it. The accuracy is pretty close to a calibrated Diamond meter I have in the shack. The bar on the (897) display is Ok, but subject to correlation and it takes a minute or 2 to figure what it is telling you.

Hope that helps.

My impression is, the dealers find out what the factory deals will be when they set up very shortly before and either do not know or are not at liberty to say what their 'Dayton prices' will be before then. Besides, why would they want to give you info on pricing that is a month down the road. Their job is to sell stuff that day at the biggest profit margin they can swing.

Hello Steve & all,

For what it's worth; I just bought an 897d from Gigaparts during their "March Madness" promotion for $710.00 US$. It involved a $70 instant rebate from Yaesu & an additional coupon from Paypal/Google checkout and has probably ended for now but it shows there are deals to be had. (I also got the LDG FTmeter($44.10) & the AT-897 ($161.0) under the same deal. There was a free dipole kit from LDG included with the tuner as well.

Just to let you know deals re available.

Yes Gigaparts has had some good sales. I picked up my 897D from them last October for $710.00. Picked up a my new 857D during the March Madness sale for $620.00. Both instances pretty good deals in my book.

25622. For Sale: Yaesu FP-30B, Perfect

Yahoo group: FT897 (2009)
Date: 2009-04-05 23:20:10 UTC
From: maritimus49
Topic: 25622 Message: 25622

Hello All -
I have a perfect FP-30B AC power supply available for sale. It was manufactured recently and works great and looks brand new. Comes with AC power cord, original box and instructions. Is a wonderful accessory for the FT-897D. Price is $150 plus shipping.

73,
Bruce K6RQR/9

25623. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: 2009-04-06 05:08:01 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 25623

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

25624. cat port cat-linier-amp NO#20

Yahoo group: FT897 (2009)
Date: 2009-04-06 19:11:18 UTC
From: TED
Topic: 25624 Message: 25624

I want to use the cat port on my FT-897D to run my AL-811 amp and my AT-897 Tuner but they both call for the cat port, my AT 897 -automatic Tuner has a cat in and a cat out port, can I run the wire from the amp to the cat out on the AT-897 tuner to work.
And please on Menue to run both should I choose cat of the three opsions. cat-tuner-amp
Thank you very much

The AT-897 only uses the CAT port for power, no data is used. Therefore, it doesn't matter what Menu setting you use on the FT-897D. Set the port for what ever the AMP needs.

From: P Grant
Topic: 25628 Message: 25628

Hi All
I have a Kenpro KR-400RC,with the SGE206 control box.
Have reconditioned the rotor motor, BUT, the controller will not co-operate by stopping at the wanted position. I have all schematics for the control box but cannot figure out the over-run problem.
Is there an easy fix ???
Many thanks in advance,,,, Peter EI4HX _._

Hello All -
I am reluctantly putting my 897D up for sale. I have moved since I purchased it and my new neighborhood is not a viable place for HF operation. The rig was purchased new about a month ago and has been lightly used. Perfect shape and works great. Serial number starts with 8L. Comes with original box, mike, manual, schematic and DC power cord. Will be double-boxed for shipment. Price is $650 including shipping to CONUS.

25630. Collins SSB Filter?

Yahoo group: FT897 (2009)
Date: 2009-04-07 17:55:26 UTC
From: Thomas Meggison
Topic: 25630 Message: 25630

I could use a little assistance. The Collins SSB mechanical filter, is there a menu that I should see that shows me that it is installed. I know I can open it and look, but I am, at the present unable to actually take the top off. Why am I asking, I purchased the 897D from a ham on QTH and in the listing it stated that it had this filter. I have this feeling that the filter is not installed. Any help would be appreciated.

Tom-

Turn transceiver "on"

Press "F" momentarily

Use "MEM / VFO / CH" to select row "n"

If a filter is NOT installed in the FIL-1 slot, the "B" tab will show "N/A"

If a filter is NOT installed in the FIL-2 slot, the "C" tab will show "N/A"

It has space for two batteries - the idea being that you charge one while running the other.
I'm not aware of it being able to charge and run at the same time off a single battery pack.

I see no reason that you couldn't use the 13.8V and ground pins of the CAT/Linear Jack. Page 18 of the manual shows the pin out. The current requirement for the meter is very low. Be sure to put a fuse in the cable though.

25645. Wide Recieve

Yahoo group: FT897 (2009)
Date: 2009-04-10 07:33:01 UTC
From: Scot Jones
Topic: 25636 Message: 25645

Hi All

I've had my Ft897 for some time now.

I'm under the impression that as I've had it modified to open it out for all the available freqs its capable of I should be able to receive say something on 250mhz.

I seem to be struggling on this though, 0-30mhz not a problem and then I only seem to be able to get the amateur bands above that.

I'm probably doing something daft?

I've tried it also with HRD and it also wont let me enter the above said 250mhz range.

Any help or pointing me in the right direction would be fantastic.

Kind regards

73's

M1AFY

25646. LDG autotuners

Yahoo group: FT897 (2009)
Date: 2009-04-10 14:29:44 UTC
From: kybarney
Topic: 25646 Message: 25646

Hello,

I know this is an autotuner question, but my radio is an FT897D and any input is appreciated.

I had a couple of questions regarding these tuners. I have both of these tuners and use them on the Yaesu FT--897D. I was tuning up 40 meters a couple of days ago on a buddipole dipole using the LDG-100Z and have never had problems with it. It smelled like something was burning but it still tuned up. Last night, it lost it's tune and I cannot tune a low SWR on 40 meters anymore. The antenna is configured correctly....

I actually had the AT-897 tuner serviced by LDG because L5 did burn up. I tried the AT-897 and could not tune up the radio on 40 meters either. I was able to tune 20 meters on the Z-100 but am wondering if the Z-100 is defective or if I damaged it too. Or worse, if I damaged the radio. Has anyone else had problems burning up your autotuner?

Thanks,

Could it be that the antenna, coax, or connectors were damaged, instead of the tuners or radio?

I had this happen on my AT200pro when trying to tune a 40 ft center fed zepp on 80 meters, although the burning smell waheating of the the epoxy used to secure the toroids to the board (I think, after looking at it).

But I had done something stupid, because I tried tuning it at full power I know better, still running the AT897 and Z100 with my portable stuff, and never have a problem at the lower powers, although the manpack antennas sometimes cause the at 897 to hunt alot.

I really think the key is to always tune at lower power, and if it can't find a match, let discretion be the better part of valor and alter the load somehow. The AT200 pro has since given outstanding service located remotely near my antenna on all other bands - but this stuff wont tune outside its generous range very well, so its best not to push it til you know your load.

Hope you're not broke :)

Hi Scot,

Nope, you are seeing what is normally seen. Even with a widebanded rig, the receiver will stay within these bands:

100kc - 33MHz
33MHz - 56MHz
76MHz - 108MHz
118MHz - 137MHz
137MHz - 164MHz
420MHz - 470MHz

Yes I smoked my at-897 also seems it would start hanging up in transmit mode just before it cooks sent it in to be repaired was fixed no charge but now when I use it they tell me I'm distorted so I made a mount for the top of the 897 put the z-11 pro on and it works better now I don't have to push that tune button every time I change frequencies.

Any idea how high the SWR has to be to trigger the "high SWR" warning on the 897

I have tuned my Super Antenna so I no longer get a high SWR warning, but am curious how has it has to go to trigger the warning.

Finaly, how accurete is the SWR reading you get when you are in the meter mode?

Thanks

The "High SWR" trips around a reading of 3:1. There has been MANY threads on this subject. Try looking in some of the past posts and the file section as well as I know there have been some files uploaded referring to SWR as well

Thank you. I looked for threads but did not find any that were particularly on target.

I am using a SuperAntenna which requires a good deal of precise hand-tuning. Have the antenna tuned well enough on 20 meters that I have now worked 20 U.S. states and around 25 foreign countries. Not sure how precise the SWR reading is on the 897D when it is in the meter setting, but obviously SWR is low enough that it isn't triggering the warning.

Had thought of getting the LDG tuner for the rig to refine my tuning, but the folks at HRO assure me I won't get any further improvement--meaning lower SWR and maybe a tad more power--by adding the tuner.

Again, thanks for your quick reply.

If you use an AUTOTUNER you may not get any better, but using a manual tuner may get a little better performance and a whole lot lower SWR than an autotuner will. An autotuner will get you safe, usually just below the threshold considered safe while a manual tuner allows you to get as low as you want, most times a flat 1:1 - an autotuner won't, usually.

Have fun!

Topic: 25636 Message: 25658

If you have had your rig "opened up" as you say you should be able to tune most all frequencies. The rig will tune to 250 mhz and can tune to where ever.

There are very few limitations and you will not be limited to a specified list of frequencies.

You can use HRD for quick tune as you can move from 100 mhz to 950+ mhz in a few clicks, or a roll of the mouse wheel.
73's,
Bill

25659. Re: [FT897] Re: SWR reading on the 897D

From: Richard Corfield
Topic: 25654 Message: 25659

The next question is how high an SWR can you sustain before you damage the radio. Is tuning manually at minimum power a risk? I can get quite good results listening for maximum noise on receive before trying transmit.

I hope to try a kite antenna if we get the weather and I hope to make it a full quarter wave so run without a tuner - tuning by trimming cable.

Thanks

Hi Danny,

The original ft-897 has a modification to allow transmission in the 60 meter channeled frequencies. An un-mod original ft-897 does not include 60 meters so i found the modification which is easy and needs a steady hand with smt solder gun. After a cpu reset which is required will re-programming memory channels if any and program the 60 meter channel frequency in memory. I use the modification successfully but found it easy to program the memory channels via the rt system program for the ft-897. 73 and Happy Easter aka Passover!

Hello at all radio friends :)
rgds from Poland,
Maby have anybody a full manual for mic MH59 in PDF the best?
I have it since yesterday and i don`t know how should i made top knobs on.
...or how to use scroll knob for adjust volume etc...
It takes few minutes to discover how to enter the frequency ;)))
In generaly it works PERFECT :)
tnx in advance

Hi Group,
1st Time poster here, Bit of a Yaesu fan as i have a ft817 ft857 ft897 a old ft200, as well as kenwood
Also using a ATAS 120a when mobile with the ft857 the combo works well,
But yesterday i tried the ft897 on the atas and nothing, I've tried all the atas setting's in menu 85, The ATAS letters that usually appear in the top right hand corner of the display are not there, also the MF row k (Tune Down Up) buttons beep when pressed but nothing else, the rig simply does not op the atas,
I've done a full cpu reset,
Its not a grounding issue the ATAS is very securly fitted to the vehicle with some good earth straps too and theres no problems with the ft857 and same atas,
Any ideas and help would be great?

Topic: 25667 Message: 25667

Ive been a new FT-897d owner for about a week now. One of the big reasons I picked this radio was to wide band it to communicate with the kids on thier GMRS radios and I saw that this could be done via a software jumper mod. Should have read further. Neither of the widebander apps work on my radio and I'm not all fired up about voiding the warrenty just yet. I'll prob just wait till the warranty is out then hard jump it.

But, I didn't come to talk about widebanding. I came to talk about wiring my CT-39 cable to feed my laptops mic and spk jacks for PSK31 using a software TNC and terminal program. Sounds simple enough but, I tried to use a straight patch from a VX-3r and managed to toast the motherboard audio circut on my laptop. Expensive lesson learned. It DID actully work and decode PSK31 for a few inticing momments and I even monitored APRS messages just before the smoke came out.

I'm using the yaesu software to manage memory and another program to control the radio on the CAT jack. but the data jack is wide open.

I found limited info on building the cable to do this, but the author says to put a 20db audio pad in the audio out line. I know what an audio pad is, but...How to wire it?

Here's your chance to help me keep the smoke in my laptops.

A) Just put a 10k and a 1k Ohm resistor in series on the hot (stinger post) line.

B) Put the 10k on the hot wire and the 1k across the hot and gnd.

C) Same as B, but swap the resistors.

D) None of the above (Please esplain your answer and provide diagrams and calculations to support your argument :))

BTW, I know it would be better to work this up with a real TNC, but I want to do it this way for feild use. Also, I know about the issue with the manual calling the data jack's audio pins "data" pins.

Thanks in advance!

Andy

25668. 2 metre tv interference

Yahoo group: FT897 (2009)
Date: 2009-04-08 14:53:42 UTC
From: hamilton9092003
Topic: 25668 Message: 25668

I have put up a 5 element 2M Antenna but wherever I put the antenna,I get TV interference on my TVs from my FT897D. I have checked locally and neibours do not get any trouble. Could it be the cable run as the cable does run close to my TV cable. Am I using the wrong cable. It completely cuts off our home TVs,even on 5 Watts. Any advice welcome. Hamilton9092003. G3XEM. Thankyou.

25669. FP-30

From: kstrsdn
Topic: 1918 Message: 25669

I am going to be buying an FT-897D this coming week. I am considering the FP-30 power supply. I have read many reviews stating that they have experienced hash noise when using this power supply especially on 6 meters. Most of these negative reviews are from 2 years ago or longer. My question is, has Yaesu made modifications to the FP-30 within the last couple of years correcting the hash problems or do they still exist? I normally use Astron power supplies on all other radios but would find the FP-30 very convenient for my application. Any feedback would be greatly appreciated.

From: rbfh1
Topic: 25671 Message: 25671

Just purchased the FT-897. Bought an MFJ-4125 external power supply and the 2 internal batteries for portable use. My questions are: Is it alright to use the external power supply with the FT-897 while the batteries are installed? If it is OK to use the external power supply with the batteries installed, is it OK to be charging the non-selected battery at the same time the external power supply is powering the radio? The owners manual doesn't seem to address these issues. Dave - N9XHL

From: kc3vo@aol.com
Topic: 25671 Message: 25672

You can charge either or both internal batteries while operating the FT-897 from external 13.8 volt power source, and the radio may also be operated at full power while this occurs. Battery selection has no effect, if operating from external power, as the external power does NOT charge the internal batteries! (Unless you also connect a lead from external power to an appropriate charge adaptor and each battery to be charged)--if done this way, with TWO charge adaptors, you could operate the radio and charge BOTH batteries. The internal batteries must be charged by connecting a current controlled, temperature sensing supply of at least 16 volts to the round connector on the respective battery. That is what the YAESU or W4RT battery charge adaptor is for! The charge adaptor provides the increased voltage and charge control needed to charge the internal batteries-they are NOT fully charged until they measure at least 15.5 volts, so charging directly from 13.8 volts without the adaptor is not going to work.--73, KC3VO, Bob Curry

From: customgraphics!
Topic: 25665 Message: 25673

from the manual:

1. Press the [F] key, as needed, to recall Multi Function
Row ?k? [TUNE, DOWN, UP].
2. Press the [A](TUNE) key to turn the ATAS-100/-120 on
(this action only supplies voltage to the antenna at this
point; re-tuning does not begin). ?Parentheses? will appear
on the both sides of the ?TUNE? indication, and the
?ATAS? will appear on the LCD.
3. Now press and hold in the [A](TUNE) key for one second
to initiate ATAS-100/-120 tuning. The transmitter
will automatically be activated, a carrier will be sent,
and the antenna?s length will be adjusted for best SWR.

Subject: [FT897] Newbi with a problem

Hi Group,
1st Time poster here, Bit of a Yaesu fan as i have a ft817 ft857 ft897 a old
ft200, as well as kenwood
Also using a ATAS 120a when mobile with the ft857 the combo works well,
But yesterday i tried the ft897 on the atas and nothing, I've tried all the
atas setting's in menu 85, The ATAS letters that usually appear in the top
right hand corner of the display are not there, also the MF row k (Tune Down
Up) buttons beep when pressed but nothing else, the rig simply does not op
the atas,
I've done a full cpu reset,
Its not a grounding issue the ATAS is very securly fitted to the vehicle
with some good earth straps too and theres no problems with the ft857 and
same atas,
Any ideas and help would be great?

One quick question.

Is there anyway to upgrade the FT897 to transmit on the 60 meter band? I tried to transmitted on that band and got a TX ERROR.

Thanks,

For the same reason I keep my laptop plugged in and charging when I use it.

1. The cord might get kicked out of the wall while I'm using it
2. The power might go out
3. I might want to take it to a different location and use it where I can't plug it in, so I want the batteries charged all the time and not have it useless while it is charging

First of all, I think it is illegal to operate the rig on the GMRS frequencies and you might be asking for some hefty fines if you do that. ($6 k to $10k from what I've read, and loss of your ham license besides)

The two resistor pad you are talking about will have the 20 k resistor connected to the radio, the 1 k connected to ground, those two are then connected together and the junction will be connected to the cable.

Yes, the charger may be able to provide enough power to run the radio on low power, as long as you have good control over your transmit power level. It's also possible that you may not have that much current available (i.e. solar) so being able to charge while running the radio on another battery might be the only way to go. It's also possible that your charge source isn't clean enough to use live.

Chuck - N8DNX

>> Me baffled and confused. If you have power to charge a battery, why run on any battery? Thought that running on battery power was for absence of other power. A small charger will provide 6-8 amps, enough to transmit at 10 or so watts. 897 on battery is limited to 20 watts. Please esplain this so I can understand.

>

The 20-50 watts is about right. SSB is not a steady state signal like CW, AM, or FM. Those are steady signals, and in the case of AM and FM, your voice is actually in the sidebands, and is a small percentage of total power transmitted.

But Single Sideband, no energy is wasted in transmitting two mirror image sidebands, when all the information needed is contained in one sideband. And no energy is wasted in transmitting a carrier. So, all energy is going into transmitting your voice.

Your voice speaking words is not a steady signal (as you get when whistling or humming) but peaks and valleys. The peaks will be close to 100 watts, but the average energy may only be 20-50 watts. If you turn up mic gain you would quickly get to a point where you would be distorting on the peaks as the transmitter tried to transmit more than 100 watts which it does not have the voltage to do.

If you are seeing 20-50 watts while you speak in SSB mode, leave mic gain alone.

The FP-30 noise problem was fixed by Yaesu some time back. My FT-897 (not the newer D) has no problem with the power supply. Mine is actually marked FP-30b.

I LIKE the built in power supply.

B4 I DO SOMETHING STUPID DID I READ THAT THE ACCESSORIE JACK ON THE BACK OF THE 897D WHICH IS A 3.5 MM STEREO PLUG COULD BE USED FOR A REQUEST TO TRANSMITT. THE TIP IS ALC AND THE SHANK TO GROUND SEND A CONSTANT CW LEVEL TO FOR TUNING A EXTERNAL TUNER. DOES THIS AUTOMATELY DROP TO 10 OR SO WATTS OR MUST YOU CONTROL WITH MENU 70??
THANKS DENNIS W5VAF

Hi Dennis,

yes it does. It allows you to tune up at low power before operating at high power. not sure off hand exactly at what power level it does it but it is certainly a low power position and is independant of the mode and power seeting for operating.

BTW, please type in lower case as upper case can be more difficult to read and is also considered to be shouting in electronic communications.

73....Eric VK2VE.

Thanks ERIC I thought id did but wasn't sure. Wanted a second opinion before i tried it. This is my 2nd ft897d. I use one in the shop and 1 for mobile or portable. My home unit is a icom 756 pro 3, I am really getting into this qrp cw stuff, it kinda grow on you. I am sorry for the ll caps but it was just easier for me to see, u know getting old. Been hamming 49 years and a retired broadcast engineer.
73's ERIC and again thanks.

Dennis-
Ring to sleeve (gnd) - Transmits CW
Tip to sleeve - Apply voltage of 0 volts to -4 volts
Gives output power of 100 W to 0 W

Go to the FT-897 Yahoo Group and look at message 18769

I modified his scheme so that I get exactly 0 Volts to -4 volts
You can do it also or use his schematic

I suggest that you check eBay for a used UHF transceiver that's type-accepted for Part 95 operation, as GMRS transmitters are required to be. The Kenwood TK-880 is an example. Have it programmed so you will not accidentally transmit illegally, as you may not transmit at all on the seven FRS-only channels and you are limited in power on the seven shared channels. Maybe build a TV-antenna-lead J-pole tuned to about 464 MHz, between the two groups of GMRS frequencies, so you can work the repeaters as well as simplex, but observe the height restrictions on GMRS antennas for the shared channels. (Your ham UHF antenna will probably not be tuned well at the GMRS frequencies.) And identify with your FCC GMRS call sign as required by the terms of your license, thus setting a good example for your contacts.

There remains one troubling thing about GMRS: Under Part 95, a licensed GMRS operator is prohibited from contacting an unlicensed or otherwise unauthorized operator.

I recommend the W4RT OFC-897 rapid charger. It will charge the FNB-78 batteries without issue and is a good buy at $85.00 USD compared to the Yaesu CD-24. The OFC-897 will charge the battery and then go into trickle charge once the battery has reached full capacity. You will also find the W4RT customer support to be top notch.

Topic: 814 Message: 25702

I installed the FC30 on my 897 with no problems but I remember looking at the illustrations pretty close and following the instructions in the 897 manual. You have to setup the radio prior to connecting the tuner. It's best to double check both manuals prior to setting up the tuner.

Hi there, Lots of questions first...
I see you say TVs! Are your TVs cable or from an antenna?
If your Tvs are from an antenna, are you using Freeview with a suitable antenna? Are you using one antenna via a multiway preamp/distrubution unit?
Do you have a TV masthead amplifier? Do you get the problem using a dummy load? Make a simple 2m wire dipole and pin it to a door using different coax so that it is not adjacent to the TV cable. How near is the new antenna to the TV antenna (assuming you are not on cableTV)? 73

Carl,

I would be interested to find out how you did your version of the switch. Am I correct in thinking that you can vary the power out from 0-100 W by adjusting the voltage to the tip. Does this work in any mode? For instance if I don't connect the ring to sleeve and use ssb mode can I vary the output power below the normal 5W minimum?? This would be great for QRPp in modes other than CW!

Enquiring minds want to know. ;->

If it's in the electrical wiring, then it's easier to fix it
at the source.

I would approach this from the antenna outwards. I'd start
with looking at the SWR of the antenna and coax. Is it high?

If so, you will want to fix that or add a choke-type balun.
It can be caused by a bad connection, or bad coax, or an
antenna problem.

If the SWR is good, then you will need to address it at the
TV or the TV preamp. Since it is affecting more than one
TV, I'd start with the preamp.

I had good a SWR with my LDG AT-897, but still had RF geting into the electrical wiring in my home. The hair dryer went nuts when I started broadcasting if it was plugged in (not being used). I added a 1:1 choke balun from RadioWavz and those problems went away.

Hello Hank
You would seem to have a big problem with Stray RF floating around your house.
To start,,,, remove the 1:1 balun,,,,, where is it installed ???
At the radio or at the antenna ???
Turn on your 897 and connect it at low power to a good dummy load. Put an SWR meter in line with the 50 ohm dummy load,,,, is the SWR @ 1:1 ??
IT is ! good. If not then the problem is in the rig,,, that can sometimes happen.
If SWR is good,,, increase the power out, until you reach max power for your dummy load!
Is SWR, still @ 1:1 ?
Good,,,,,, NO,,, Check out the interference on the TV system,,, and the hair drier,,,
Is there a problem ??? No good,,, YES, this means the problem is in the radio...
If no problem,,,, change the dummy load to the end of the antenna co-ax,,,,, start again, on low power,,, keep a watch on SWR,,, increase power,,, keep a watch on TV ect. for interference,,, if there is interference at this stage,,, problem is in the feeder system,,,, check the route of the co-ax all the way to the antenna,for close proximity to Household wiring and TV co-ax,,,.
You did not explain what antenna you were using for 2M band,,, and no information on using different mode???,,,, what quality of co-ax for the antenna,,, do you have a TV antenna ???
Are there any other tenants on your TV system ??? Are they affected ???
One last thing you can attempt,,, if its your own system,,, Make an isolating transformer ,,, [filter] ,,two lengths of cable [split a piece of speaker cable,, use 2 colours]- each 12 inches long,,, twist them together,,, then wind them around a ferrite ring,,, about 6-8 turns. Install a TV co-ax plug to each pair of ends,,,[same colours] should be about 4 inches overall,,,plug this into the main TV set,,, connect the remaining TV cable back in circuit,,, switch on TV,,, Try out and see is TVI eliminated ??? Yes !! OK,, Connect up the FT897 again to the 2 M. Antenna,,,, is this OK now???
Well done Hank.... you have solved it,,,, I HOPE...
Finally... change the "filter" to the main TV feed line.... this may now cure the problem for good... I HOPE...
Let us all know how you get on.

Can anyone recommend any XP software that allows a PC connected to the key jack socket to be used to send CW by typing at the keyboard?

It looks like the ACC plug on the radio goes to the ALC plug on the amp, but I can't figure out where the relay connection on the amp hooks up to the radio. Also, anyone know of a cable source?

Hello..

I bought a second hand 897D. The guy I got it from complained about only 50 watts output. I see 50 watts on my tuner meter.

How can I check the setting for TX power output.

I have above A,, SPOT.. B,,BK... AND C,, KYR..

I need menu mode. I think.. The manual is confusing..

I have read many reviews stating that they have experienced hash noise when using this power supply especially on 6 meters. Most of these negative reviews are from 2 years ago or longer. My question is, has Yaesu made modifications to the FP-30 within the last couple of years correcting the hash problems or do they still exist? I normally use Astron power supplies on all other radios but would find the FP-30 very convenient for my application. Any feedback would be greatly appreciated.

The FP-30 noise problem was fixed by Yaesu some time back. My FT-897 (not the newer D) has no problem with the power supply. Mine is actually marked FP-30b.

I LIKE the built in power supply.

If you hold down the F key you get the menu. Rotate the top right knob until it selects "RF Power" and use the dial to adjust.

There are other engineering menus that effect things, but this menu is the first thing to look at.

25721. Re: [FT897] 2 metre tv interference

Yahoo group: FT897 (2009)
Date: 2009-04-16 14:44:10 UTC
From: Richard Corfield
Topic: 25668 Message: 25721

Have you tried with a dummy load? If the interference goes then that confirms that the problem is RF pickup from your antenna system or its wiring.

Was the cheap 75ohm cable the TV or the transmitter? TV is normally 75 ohm, and a lot of cables are cheap. Still, we have the nasty one that came with the house and a mast-head amplifier with the TV antenna on the same mast as the amateur antenna and so far (fingers crossed) we've been OK. Still, the amateur antenna is off axis to the TV antenna, and the TV antenna is below the amateur's radials. There's a loop in the amateur antenna's feeder above the TV antenna, but that shouldn't be enough to get rid of any cable radiation if there is any.

If you suspect your TV download could you do a temporary run from the antenna down to the TV even if you have to run over the floorboards or through windows? Just to check it?

If the problem is coming in on the outside of the TV downlead then a ferrite before the TV may help. If it's coming in from the TV antenna then a high pass filter may help. If it's getting into the TV's box then nothing will help, but 5W is not much power. If you have a walkie talkie try that at 5W near the TV.

If you can get hold of the current UK Full Licence Manual it has some useful ideas on this. Cutting off sounds like it may be overloading the RF input of the TV, though it's a little while now since I've read my manual.

WinWarbler, a member of the free-ware DXLab Suite, can drive your FT-897's CW key input via an external 1-transistor interface controlled by a serial port modem control signal or a parallel port data signal. Some commercial interface products include the required circuit, or you can easily build one yourself.

WinWarbler is available via www.dxlabsuite.com

The pin you want is the TX GRND pin in the CAT/LINEAR Jack on the rear. This is an 8 Pin Mini Din plug. Should be available at Fry's or some RS stores. Looking at the connector on the rear of the radio the pin is at the 7 o'clock position on the connector. I use an 18ga wire and plug it into the socket. The ground of the wire is connected to the case screw on the rear. This wire then goes to the Key line on the linear.

Good Luck

In what mode are you seeing only 50 watts?

Menu 61, if the meter is set to read power, and you are in SSB mode, and if the radio is set to 100 watts (Menu 75), then you will only see 20-30 watts as you speak, and that is normal. Try setting the radio to FM and key the mic, see what power it is putting out.

Richard's advice is excellent.

The one thing I want to add, is that any input to the TV can couple
unwanted RF in. The power cable or DVD cable could be acting as a 2m antenna. Ferrites can help with this.

In what band? In (VHF) 2M max power is 50W, go to MENU MODE No 075 and see the setting.
For short wave you must make a new setting for No 75.

Hello AlL

I found how to get into menu mode.. And the PWR setting is 100 watts on the HF bands.,

But I and the person that had the radio is only getting 50 watts.. I am reading 50 watts on a MFJ 969 tuner when its set for dummy load mode.

Is there a way to totally reset the radio.. REboot so to speak..

Can anyone shead some light on the problem

Thanks

You can only read the full 100 watts in CW or FM modes. SSB will only have output when you talk and 100 watts will be the peak. How m uch you get will depend on your voice characteristics so an average of 50 watts or less will be good

Hello AlL

I found how to get into menu mode.. And the PWR setting is 100 watts on the HF bands.,

But I and the person that had the radio is only getting 50 watts.. I am reading 50 watts on a MFJ 969 tuner when its set for dummy load mode.

Is there a way to totally reset the radio.. REboot so to speak..

Can anyone shead some light on the problem

Thanks

Mike WB2GLW

Hello..

I bought a second hand 897D. The guy I got it from complained about only 50 watts output. I see 50 watts on my tuner meter.

How can I check the setting for TX power output.

I have above A,, SPOT.. B,,BK... AND C,, KYR..

I need menu mode. I think.. The manual is confusing..

Mike WB2GLW

From: D. F.
Topic: 25711 Message: 25735

On the MFJ-969, yes there is (supposedly). If you look at the front where the selector knob is, you should see a setting for "dummy load". I haven't tried it, so I do not know how well it works. Maybe someone more acquainted with it could tell us. There is a hidden "service menu" within the 897/857 radios. It COULD be that someone may have adjusted this setting lower than what it should be. IF you go into this menu, however, BE FOREWARNED that you could severely damage the radio making adjustments that ought not to be done - BE VERY CAREFUL IN THIS MENU!!!!!!!!!!

Good luck!

Dennis - N8BMB

25737. Using Heil Pro-Set Plus

Yahoo group: FT897 (2009)
Date: 2009-04-17 13:34:50 UTC
From: ctwickey
Topic: 25737 Message: 25737

Greetings,

I may be opening a old can of worms, but here it goes.

I have the FT-897D with the Heil Pro-Set Plus connected to the radio. I am using the LDG AT-200Pro Autotuner with a 4:1 balun and Cobra Junior Ultra-Lite Antenna. no amp, what so ever.

Anyway, the question is, what would be the recommended setting on the Menus #45 through 49, plus #63 and 74 with this set up that I have?

I have tried some of the setting that was listed on this group, but I do not recall any of them using the Heil set up. I have been told that I have no lows, but I have the punch in my transmissions.

Cliff, N6CTW

From the FT-897 Manual, page 65
POWER-ON MICROPROCESSOR RESETPROCEDURESSome or all transceiver settings can be reset to their factorydefault
states using one of the following power-on routines:
menu settings to their factory-default values:
Menu #06 (
56 (
83 ([V/M] + POWER on: Resets all memories and followingAM STEP), 33 (DCS CODE), 52 (FM STEP),MEM TAG), 76 (RPT SHIFT), 82 (SSB STEP), andTONE FREQ).
following menu items) to their factory-default values.
Menu #06 (
56 (
83 ([F] + POWER on: Resets all menu settings (except theAM STEP), 33 (DCS CODE), 52 (FM STEP),MEM TAG), 76 (RPT SHIFT), 82 (SSB STEP), andTONE FREQ).
and menu settings.[HOME] + POWER on: CPU master reset for all memories

>Look on page 66 of your opeating manual. If you don't have one (as I suspect since you bought it second hand), you can download a free PDF manual from Yaesu.com. You can get to it faster if you Google FT-897D + owner's manual . It's 5.17 MB long. Or you can copy the link below:

http://www.yaesu.com/indexVS.cfm?cmd=DisplayProducts&ProdCatID=111&encProdID=64C913CDBC183621AAA39980149EA8C6&DivisionID=65&isArchived=0

Congratulations, you have a good, versatile radio. Once you get the manual and start accessing the menus, it will be fun.

> Date: Friday, April 17, 2009, 4:25 AM
>
> Ok, don't reset yet. Page 2 of the FT-897D manual says you should have 100 watts in SSB/CW/FM. I don't know anything about the non-D version. Here is a copy of the section from page 2:

RF Power Output (@13.8 V DC): SSB/CW/FM AM Carrier
160- 6 Meter: 100 W 25 W
2 Meter: 50 W 12.5 W
70 Centimeter: 20 W 5 W

If you reset, try the least volatile one first: F + Power is the least and HOME + Power wipes out EVERYTHING.

Some or all transceiver settings can be reset to their factory default
states using one of the following power-on routines:
 [V/M] + POWER on: Resets all memories and following
menu settings to their factory-default values:
Menu #06 (AM STEP), 33 (DCS CODE), 52 (FM STEP),
56 (MEM TAG), 76 (RPT SHIFT), 82 (SSB STEP), and
83 (TONE FREQ).
 [F] + POWER on: Resets all menu settings (except the
following menu items) to their factory-default values.
Menu #06 (AM STEP), 33 (DCS CODE), 52 (FM STEP),
56 (MEM TAG), 76 (RPT SHIFT), 82 (SSB STEP), and
83 (TONE FREQ).
 [HOME] + POWER on: CPU master reset for all memories
and menu settings.

From: Geoff Blake
Topic: 25711 Message: 25741

Throughout this thread, I have not seen anybody suggest checking the power meter. It is just as likely that the MFJ is reading low as it is that the FT897 is not putting enough power out.

The best way of checking is to use a decent power meter, like a Bird or HP/Agilent (with appropriate attenuators). Make sure that you know the calibration of the equipment. Of course, make the power measurement in FM or CW mode as has been said before

I've been looking at the Heil (don't tell the XYL ;-)

Which insert do you have? One of their inserts is designed to have little
low frequency response but give that extra punch.

Yahoo group: FT897 (2009)
Date: 2009-04-18 10:22:50 UTC
From: Chris Baker
Topic: 25711 Message: 25743

slightly off topic but hope this helps:

969 ATU
Switch Antenna selection to Bypass
Select Dummy Load
Ensure Red meter button pushed in (ie switched on)
Ensure meter 30/300 button NOT pushed in
Switch rig to CW/FM and transmit, 969 meter should read Peak power.
If on SSB, select on 969 to read peak (not ave) by ensuring peak/ave button (under Antenna selector switch)
Whistle up rig and power meter should indicate max power
On my 969/857 on 14Mhz, on peak reading I get 100w when talking, on ave it shows 25W.

also try using another external power meter

25744. EhoCW won't PTT on my 897D

Yahoo group: FT897 (2009)
Date: 2009-04-18 14:06:11 UTC
From: Adam Filkins - KD8CCX
Topic: 25711 Message: 25744

Hello All,
I am trying to get EhoCW set up to use on my FT-897D, but it will not use the PTT function. I have had this program set up before, but the version has changed, and so has my computer. I am running Windows 2000, but have the PTT function working fine with Ham Radio Deluxe. Can't figure out why it won't fire off. Any help on this would be appreciated. I am wondering if the new version works well with Win2k or not, but can't find the older versions.

73's and thanks in advance for any help!

The only time I had trouble (twice) is when I modified a repeater
freq and tried to upload it.
After I found the error I had made and corrected it I had no problem uploading it.
I have uploaded about 160 frequncies and only had 2 errors and they were both mine.
Make sure you have everything correct before hitting the upload mode.
Not to say this is your problem, but it has been mine before.
Bill, k3waw

To All,

Be Careful...unless Heil and Yaesu have gotten together on this and solved the RJ-45 "form-fit and function" problem its probably not worth the aggravation. I have never been able to get the Heil R J-45 adapter to properly mate with my Yaesu FT-897. It fits loosely and does not make proper electrical contact with the radio. (I have, using a variety of "toothpicks" been able to get a decent electrical connection, but its still a real pain !!!)

For what's it worth department

I've been looking at the Heil (don't tell the XYL ;-)

Which insert do you have? One of their inserts is designed to have little low frequency response but give that extra punch.

I wish to thank everyone for all the advice I have recieved. I think the FT897 is a great rig. As I am getting on in years,I have decided to use 2M when the Telivision is not in use. I cannot get under the floorboards again. I may try the filters but that is as far as I will go. Thanx again everyone. I will close this subject now. Peter. G3XEM.

According to the Heil Website the Pro-Set Plus comes with both the HC-4, also known as the DX Dream Machine which produces a high punchy sounding voice AND the HC-5 Full Range Element which will give you the lows you desire.

Information can be seen here

http://www.heilsound.com/amateur/products/prosetplus/index.htm

Now all you need to do is find out HOW you switch between the two elements.

If you can't figure it out here's the email addy to send your questions to.

There is a switch on the headset. Both elements are installed at the factory.

I know this maybe elementary, but menu item 075, RF POWER SET, is it on 100?
You can try the master reset, HOME + PWR (when unit is turned off of coarse)

Otherwise, there are "tune settings" that can be done, but I would recommend getting the "repair" manual from Yaesu before you attempt them. I got one for mine just to have and it was like $10 and includes all the tuning steps, and how to do them, plus everything you could ever want to know from a techy side of things

Cliff, I use tghe pro set and love it. The problem you may be having is the element selected. Iam sure you know it has 2 elements. The 4 is for punch to get thru noise and pileups. The 5 is used for general rag chewing. This is where you get the lows. Use this element for the most part. You switch between them by the small switch at the mic. You may have to remove the foam wind filter to see the switch. On my 897 I have the settings as: 45-240 46-100 47-6000 48-Both 49-10 63-50 74-80. I might add that Heils are made to NOT pick up background noise so it is recommended that you increase your mic gain. I put mine up from 50 to 85 and get very good comments on both power and audio.

Hope this helps. You can always call or email Heil, they have a very good support system there. Always had a quick reply for questions.

Larry / nr3r

I just got my ProSet Plus last week. It has both H4 and H5 filters and the sound is out of this world. Well worth the money. The phase switch is great for reading a weak station. Flip it over and go from a rich spacious sound to the "center of the head" setting for those hard to hear stations.

Richard,

Just a note, I recently sent my FT-897 (bought new in 2003) back for repair to the CA facility. It had the low output problem because of the mis-adjusted bias currents and ultimately blew up the FET in the exciter stage. Of course I went in to fix it, and did, but i was poking around in there and accidently shorted something out and the radio shut off and would not turn back on.
I had no other choice but to return it for repair. My experience with them was good. I shipped the radio ground from MA to CA, the facility called me when the radio arrived, they looked at it and quoted me $190.00 (mostly labor of course)+ shipping to repair and return it to me. (2) weeks later I got the radio back and it is now working like a champ again. They even re-programmed all my memories back in for me.

Not bad..I was happy to spend $190 bucks to get this radio back...cheaper than replacing it.

Good luck with yours.

73,

N1ONE

From: N1ONE
Topic: 25307 Message: 25761

Hey Gordon,

I have both the FT-897 and the FT-450. I use the ft-897 at my summer camp...during the summer. I bring it home in the winter and it sits next to my FT-450. I have noticed the same as you, I have both units on the same 80M dipole, same tuner, DSP off on both radios, IPO off, ATT off and everything. I notice that the 897 has about (2-3)s units more noise than the FT-450. The FT-450 does have IF DSP and is more effective at eliminating the noise from the signal you want to here. The FT-897 does a good job, you just have to spend a little more time fiddling with the IF shift and the audio dsp to get the weak ones.

That being said.....I would not trade my 897 for anything, it is an awesome radio for my summer camp and is hard to beat for all round versatility.

Good Luck,

73 N1ONE

25762. Re: Buy FT-897 vs FT-950

Yahoo group: FT897 (2009)
Date: 2009-04-19 12:40:44 UTC
From: N1ONE
Topic: 25333 Message: 25762

Hey John,

I went through this same thought process back in 2003, I also bought the FT-897 as my first(modern)HF rig for all the same reasons you stated. I can tell you that I don't regret it one bit. I have now moved on to other radios with IF DSP and other features, but my trusty FT-897 is used ALL summer long at my summer camp, it is great to have a radio as versitile as the 897. I am sure that even if you upgrade to a more capable rig in the future, you will always have plenty of reason/situations where the 897 will fit the bill perfectly.

Good luck and enjoy the radio.

73,

N1ONE

> >
> > I know there is quite a difference but here is my dilemma. The 897D has VHF and is small to take with me when I travel to VA. However, I am not sure I am a fan of all the menus to get things done. The 950 has less menus and more controls, better receiver, but no VHF and is larger to haul. So, if you have had experience with both what do you suggest. I keep thinking I have the HT for VHF and can always go mobile.

Hi Andy,
The schematic shows a 3.15 Ampere, surface mount fuse, near the CAT jack.
Mine was blown, so I jumpered it with and short piece of fine wire. I needed the 13.8 volts to run the LDG AT-897 tuner.

Mine has come back from repair by a local specialist. Apparently a previous repair had used an acid based solder or glue and resulted in corrosion of some tracking. This has now been fixed and I'm told it is otherwise in good condition.

It's interesting to note your comments on the 897 versus the 450 as I was wondering about the 450 and noticed some second hand at similar price though I'd have end up buying another radio for VHF/UHF. I went for the 897 in the end for versatility. There are so many good radios out there for so many jobs. Another one I eyed up was the 817. Still, so far the 897 has done well. It seems better after its repair too. I'm looking forward to trying it on HF again, but must get past the "don't want to break it again" nerves a little, daft as that may be.

Hi Gary,

go back and read the manual, it's how the radio works. Most of teh yaesu radios I know work that way. I have the FT-100D, 817 and 897 and they all work this way.

Apart from the programmed Amateur bands, there are 2 extra bands, one HF and the other VHF/UHF which remember out of Amateur band frequencies, however, if you tune one of them into an Amateur band you will then have 2 of that band.

Tune one of them out of the ham band and you will no longer have the extra one of that band.

73....Eric VK2VE.

I think that happens when you re tune one of the upper bands to a frequency that is below the band below it. Then the band display seems to reorganize itself. You might be able to move the offending band back up higher. Earlier, in December or January someone sent me a post to explain it so if yu search the archives you can probably find it

Hi Andy,
Pin 1 Black, minus voltage, connects to battery and to radio.
Pin 2 Yellow, conects to Pin 4. Tells CD-24 charger that battery is connected.
Pin 3 Red, positive voltage, connects to battery and to radio.
Pin 4 Yellow, conncts to Pin 2.
Pin 5 Blue, straight throught to radio, to LED, tells battery is being charged.
Pin 6 White connects to thermister, 12.8 K ohms, to Pin 1 detects battery temperature while charging.
Connector is standard 6 pin microphone connector.

From: George
Topic: 25758 Message: 25771

There is not a method to prevent this. The radio is operating as it is designed.

When you tune outside the normal band ends the radio creates a new "soft band" for that location in the spectrem and places it appropriately in the scroll of the bands. If you later than go to a different band (say 80 instead of the 40 you were previously in) and tune up towards 160 out of the 80 band edge that previously created "soft band" around the 40m band will disappear and be replace by the new 80m area band.

This can be usefull. I have set mine to automatically come up on the 10.0mhz WWV signal.

25772. "Mint" 897-D for sale on eBay

Yahoo group: FT897 (2009)
Date: 2009-04-20 15:46:48 UTC
From: Lew Phelps K6LMP
Topic: 25772 Message: 25772

For anyone who is interested, an eBay ham radio equipment dealer in Georgetown, KY (seller ID "radio-mart") has a "Boxed Mint Condition" FT-897D for sale on eBay, auction item 260395367882

Current price is $325, 6 bids. Seller has set it up as a private auction so there's no way to tell whether that's two bidders or six. Auction ends Sunday, 26 April at 6 p.m. EDT.

Might be a good opportunity for somebody looking to pick up an 897D.

Lew K6LMP

25773. Can't write memory using FTBasicMMO

Yahoo group: FT897 (2009)
Date: 2009-04-21 20:18:55 UTC
From: Jerry Johnston
Topic: 25773 Message: 25773

I downloaded and saved a memory file using FTBasicMMO. I then performed a master reset (V/M + F + Power On) which cleared all memory channels and settings. When trying to use the FTBasicMMO file to write back to the 897's memory, I receive a "No acknowledgement from the rig that data was received" error from the software, and the 897 flashes "Error" on the screen.

The settings are correct since I can write the FTBasicMMO default memory list (which is empty but for 1 channel) to the 897 without any problems. So Com Port, Baud, etc. are all correct and working. Only when using my saved memory file do I get an error.

Any ideas or suggestions?

Silly question -
Have you registered FTBasic MMO?
If it's not registered, then you can't write to the radio.
If you are using Vista, you have to go thru extra steps to get it to
recognize the registration all the time.

I set the baud rate to 9600 and cat/linear was already set to "cat". I'm not sure what you mean by turning mem#1 on, but I did set the radio to memory channel 1 before turning off.

Turning rig on (while holding Mode <> keys) had same effect.

To All,

Be Careful...unless Heil and Yaesu have gotten together on this and solved the RJ-45 "form-fit and function" problem its probably not worth the aggravation. I have never been able to get the Heil R J-45 adapter to properly mate with my Yaesu FT-897. It fits loosely and does not make proper electrical contact with the radio. (I have, using a variety of "toothpicks" been able to get a decent electrical connection, but its still a real pain !!!)

For what's it worth department

I've been looking at the Heil (don't tell the XYL ;-)

Which insert do you have? One of their inserts is designed to have little low frequency response but give that extra punch.

Take a look at the MFJ 998 Auto Tuner. Or one of their lower power rated auto tuners. Mine will tune damn near anything.
Love it. One button tune, tunes in 4 seconds or less typically in 1 second.

Subject: Re: [FT897] Re: SWR reading on the 897D

If you use an AUTOTUNER you may not get any better, but using a manual tuner may get a little better performance and a whole lot lower SWR than an autotuner will. An autotuner will get you safe, usually just below the threshold considered safe while a manual tuner allows you to get as low as you want, most times a flat 1:1 - an autotuner won't, usually.

Have fun!

Subject: [FT897] Re: SWR reading on the 897D

Thank you. I looked for threads but did not find any that were particularly on target.

I am using a SuperAntenna which requires a good deal of precise hand-tuning. Have the antenna tuned well enough on 20 meters that I have now worked 20 U.S. states and around 25 foreign countries. Not sure how precise the SWR reading is on the 897D when it is in the meter setting, but obviously SWR is low enough that it isn't triggering the warning.

Had thought of getting the LDG tuner for the rig to refine my tuning, but the folks at HRO assure me I won't get any further improvement- -meaning lower SWR and maybe a tad more power--by adding the tuner.

Again, thanks for your quick reply.

I suggest that anyone bidding research the reputation of the seller on QRZ.com or eham.net.

For anyone who is interested, an eBay ham radio equipment dealer in
Georgetown, KY (seller ID "radio-mart") has a "Boxed Mint Condition"
FT-897D for sale on eBay, auction item 260395367882

Current price is $325, 6 bids. Seller has set it up as a private
auction so there's no way to tell whether that's two bidders or six.
Auction ends Sunday, 26 April at 6 p.m. EDT.

Might be a good opportunity for somebody looking to pick up an 897D.

Caveat emptor! I bought an oscilloscope that was in "Great condition" "Works great"
"Probes included" from radio-mart. It showed up with a rusted case, one external ground
probe, and a loose CRT that needed aligned badly. They had very carefully posed
pictures on the listing that didn't show the rust, and it wasn't shown turned on. My mistake.
My fault for not checking on it more. Just be very careful if you buy from them.

My 2¢ - hope others can learn from my mistakes.

Checking his reputation on Ebay, he has one negative feedback in thelast month, 20 in the last 6 months and 37 in the last 12 months. He also has 1 neutral in the last month, 6 in the last 6 monnths and 22 in the last 12 months.

Here is a rather disturbing one, since whenever I've dealt with goods damaged in shipment, the insurance will only deal with the person that shipped the item.

I don't think it's off topic at all. I appreciate people bringing it to my attention that this seller isn't honest. They are not bashing the seller and are only stating information that is freely available from ebay.

Hello,
I for ONE... don't think that this off topic.... I think that it needs to stated for all to know.

I had two occasions of dealing with this Seller... and on each time.. the item was stated as near perfect etc. on and on with the high praise. And when I received them they were JUNK... one I got money returned after a long dialog with the seller. The second one.. he tried to say that it was the fault of UPS.... However there wasn't any external damages to be seen.... and UPS wouldn't pay anything... and I didn't blame them. I knew who was at fault !!

WARNING !! What that seller has to say is all lies !!

I don't think it's off topic at all. I appreciate people bringing it to

my attention that this seller isn't honest. They are not bashing the

seller and are only stating information that is freely available from

ebay.

I notice Radio-Mart also doesn't list past sales item numbers...all sales PRIVATE, which usually means they are hiding something....He doesn't want us to see what has been sold in the past and the comments that go with that sale.

Hi.
For sale is a FT-897D S/N 4J400XXX in real good Condition.
In all this years the radio has been used for a few hours only due to i am a Truck Driver and i am never at home.

The unit always been used as base and never on mobile set up. The only thing that this unit has a a little scratch on the screen but dont affect the display in any way and it is hard to see, but i want to say and offer as much info as i can about it.

Everything is original, never modded, never opened.
When I purchased this radio from HRO I ordered the 2.3 SSB filter and the internal Power Supply FP-30 i think. They put Those item for me and once in my QTH everything was plug and play.

I sent this radio to Yaesu in California before the warranty expired for a check out and they realigned it and fixed something related with AM mode that it was a bug from factory. If i remember correctly they changed some diodes on the AM circuit.

The radio was trouble free before and after. Never had any problems with it.
If I SMOKE?
YES, outside, not inside the house and this radio is been used once awhile like i said before and you can be sure it is the truth.
I have to the LDG external meter that it will be included in the deal. The light in the meter went off but i never openned to fix it or replace it. aside of that everything else is working great. I am using a MD-100 Desk Mic that i will give it away in the deal.

it is a little dusty cause i dont touch it at all, I control the radio thru my log program and computer interface when i used it all this years.

Well, any other info about it you can email me to the folowing email address
lnaelis@msn.com

I'm 76 and have developed a habit of buying only brand new
stuff. I grew up during the so called Great Depression of the thirties and
got tired of hand me down things. In fact if I had had only female older
cousins I might've had to get used to
dresses or or at least very flowery shirts. Fortunately I had some male kin.
My point is that buying used on the net can
put you into some very dubious deals and one needs as much help as you can
get to avoid fraudulent sellers..

25794. Static Crash-Type Noise On All Bands

Yahoo group: FT897 (2009)
Date: 2009-04-22 17:56:56 UTC
From: N4CQR
Topic: 25792 Message: 25794

I recently discovered my 897D to start breaking the SQ. with a static crash type of noise. Similar to what would be heard when a thunderstorm
is near. Signal registers from silence to 10 over S9.

I get the same thing with or without an antenna connected. And on every band. AM is the worst but it also happens on FM. Especially 444.625mHz.

It has the FP 30 and I don not have a spare supply to power the radio.

Both the radio and FP 30 are in warranty. But I wanted to check here in case I missed something.

Same symptom when the rig is reset and I did do the relay cleaning step.

Craig

25795. Symptom of Blown Finals

Yahoo group: FT897 (2009)

From: richardkd0gdv
Topic: 25795 Message: 25795

All, I'm fairly new to the group and also new to the rig.

What are symptoms of blown finals? I've made the mistake in the past of tuning the rig with my AT-100Pro and the radio on 100W. I got the "HSWR" reading in the rig and it seemed to roll back, but I'm curious about what the symptoms would be of blown finals. I don't have any diagnostic equipment at this point--only what's displayed in the radio and, from what I've read, that's notoriously suspect.

I seem to be getting out OK on HF and VHF. Depending on band and conditions, sig reports can be 5/9.

Thanks.

IF you are getting out , the finals aren't blown. The high swr shut
down circuit protected it.

Well, take your radio out on the fresh air...and plug it
up to the car 12 volt outlet... and listen... when this
statick sparking is still there... then some caps are
shortening...(inside in the radio...). You can use
a few meters of wire as an antenna.. Or you can listen
another trans. SW radio for similar noise...

George.

If you are getting good reports, most likely the problem is not your finals. You wouldn't HAVE a signal if finals were blown, especially on HF/SSB. Seems as if you have an SWR issue of some sort. Check ALL connections in the feed line, both at the rig AND at the antenna. Is the coax firmly in the pl-259's? Are they not tightly (hand tight) connected? Is the connection at the antenna water sealed? If those are fine, check the coax itself for cracks, kinks, loops, etc. I had a similar problem happen out of the blue, turns out the local squirrels ate, YES ATE, through the coax (shielding included) right in the middle where I had run through the trees. If you don't have one, it would be wise to get yourself an antenna tuner, manual preferably, as this would allow you to keep an eye on the SWR and allow you to attempt to tune the problem down, if possible. If you cannot get the SWR to come down to an acceptable level, my bet is either there is a problem with the coax and might need to be replaced altogether or there is a problem with connectors somehow. By the way, DO NOT USE crimp on connectors! They do not last long and I have had problems with them in the past.

Good Luck!

Dennis - N8BMB

Radio tested on 12V about 6 miles from the house. Same problem. Called Yaesu, we went through some stuff, same thing. Other radios in the house suffer no such symptom. (eton E1xm, Lowe 150, FT-990, FT-101 etc..)

As stated, radio is in warranty and will go back to Yaesu for service.

Thanks for the input.

Issue closed.

hi
had same issue- do search for 897 squelch mod- worked fine for me-
added a cap and unbelievable difference-if you can't find mod, email
me directly- like the squelch had breakthroughs for no reason at
all-- i have a copy of it somewhere but readily available on web

A lot of the initial FP-30 power supplies had BAD BAD switching noise but the noise was there all the time and didn't crash like a thunderstorm.
A local power line could have a leaky gas discharge unit or a broken insulator. Static buildup on the power line gets radiated along the line and can be heard for a long distance. It starts off low in noise and then builds up to where the static discharges and the noise goes silent. after a few minutes it starts off softly again and builds up for a repeat performance. You can sniff it out using high frequency and short antenna .
Presumably the noise is not on your rig when the antenna is
disconnected.

Can you get it to do that by tapping on the radio or anything else to make it make that noise? There is a good article in the May QST magazine about repairing intermittent problems in a rig.

Hi Bob,

Since the "fixed" squelch threshold can be adjusted via the service menu I wonder why you needed to do a hardware mod? My receiver was set a little loose on the squelch threshold and a little tweaking with a service menu setting fixed the problem. Maybe it was a different problem. Of course messing with the service menu is dangerous so you need to be careful.

I sure hope this thread doesn't go into the transgender topic.Oh boy, only in cyberspace.

Excellent point made Harold. When I first got into the hobby I would buy anything and from everywhere. Over the years I learned, buyer
beware

Now I only purchase Yaesu products and then usually from just one vendor.

I sure got burned alot as a newbie. I bought a 6 meter preamp offof the QTH.com site and when it arrived the unit was broke into pieces. I sent a eMail to the sellar and he replied"Will now you will have something to work on over the winter" Burned by anoher Ham.......unthinkable at the time.
Still got the preamp, still in pieces.

Good luck to everyone on your purchases.

I'm 76 and have developed a habit of buying only brand new
stuff. I grew up during the so called Great Depression of the thirties and
got tired of hand me down things. In fact if I had had only female older
cousins I might've had to get used to
dresses or or at least very flowery shirts. Fortunately I had some male kin.
My point is that buying used on the net can
put you into some very dubious deals and one needs as much help as you can
get to avoid fraudulent sellers..

Hello,
I for ONE... don't think that this off topic.... I think that it needs to

stated for all to know.

I had two occasions of dealing with this Seller... and on each time.. the item was stated
as near perfect etc. on and on with the high praise. And when I received them they were JUNK... one I got money returned after a long dialog with the seller. The second one.. he tried to say that it was the fault of UPS.... However there wasn't any external damages to be seen.... and UPS wouldn't pay anything... and I didn't blame them. I knew who was at fault !!

WARNING !! What that seller has to say is all lies !!

I have built a 6M C-Pole antenna and raised it up to about 40' for the Spring. Using my Telewave Power meter vs. the "ticks" on the 897,(and the article referencing the tick marks vs swr), (with the AT-897 off but inline) I get somewhat different readings on swr. The Telewave shows the swr to be better higher in frequency than the 897 by about 250KHz. Not a big deal but I wonder what is going on here. Perhaps the 897 is not looking at 50 Ohms, I assume the Telewave is matched at 50 Ohms. It seems to be when I put a good quality dummy load on it, and with the 897 the good dummy load shows a "tick" mark of 1 (this can probably be attributed to the AT-897 being in line). The Telewave also shows lower and higher swr than the 897.

Bypassing the AT-897 altogether and coming right out of the 897, a quality 50 ohm load shows no swr reading on the 897, and about 1W reflected on the Telewave (1.33:1). Paralleling 2 quality 50 ohm loads (which should be 25 ohms or 2:1) shows 2.8 marks on the 897 and 15W reflected on the Telewave which according to the article means 1.5:1 and 3.4:1 using the fwd and ref equation. Nothing is getting very precise here.

I haven't tried measuring the swr with the Telewave straight out of the 897 without using the AT-897 yet. That may be next.

It is not a big issue, but being somewhat anal, I wonder what is going on. This always happens to me. It may be the 10% variation that I am seeing.

Haven't made any contacts with the 6M c-pole yet, but I just got it up today.

Hi Dave

SWR is not the same every place on the cable (for the most part).

If you were to sample your swr every foot, you would get a different reading.

We had to do this in school at 120mhz measuring every ¼ wavelength.

I would NOT depend on the SWR meter in the radio, but I would trust a Bird watt meter or your Telewave assuming it has been calibrated at some point.

Short story, if you go looking for trouble, you□ll find it! ;)

Now, just get on the air with it!

Amplitude of the standing wave will vary like a cosine wave (Or sine wave) however, the standing wave ratio, the maximum standing wave divided by the minimum standing wave that you measured, will be the same any where it is measured by an SWR meter which measures the forward power and the reflected power and computes the ratio of the max divided by the minimum standing wave.

It is something I'm trying to understand. Maybe I'll have to re-read the books on it.

Impedance changes as you move down the cable because at each given point the current and voltage in the standing wave will be different. I assume that at no point it would be 50 ohms resistive because if it is so then it will be so along the whole cable. Even at points where it looks like 50 ohms there'd be a reactive component due to the mismatch.

Still, quarter wave segments were meant to be good for transforming impedances. The formula given was Zin^2 + Zout^2 = 50^2 for 50 ohm cable which is how an open circuit radial or a stub filter (Zout = infinite) can appear to have Zin=0 at the quarter wave frequency. I wonder if there's a complex version of that formula for dealing with complex impedance (or even if as given it works for complex impedance) and what the formula is for lengths other than a quarter wave.

Richard -

Scientists, Engineers etc. always presume ideal situations. How often have you heard phrases like; "Ignoring Friction", "ignoring Gravity", "Ignoring Resistance" and in the case of cable, "Ignoring impedance lumps"?

Like the proverbial "Isotropic Radiator" the allusive perfect cable does not exist due to impurities, conductor diameter variations, dielectric variations etc. However, there is an old saying when it comes to using the cable..."Close enough for Government work." Accept the minor variations and "Don't sweat the small stuff."

The use of the formula, with a little allowance for starting too long and cutting small lengths of cable off until it works, could be good for deliberate transforming of impedances. Still, ideal is often close enough in these situations. The effect of nearby objects on antenna I think is the big exception.

It's also interesting to try to understand what's going on.

Hello Richard!
I too have been very interested in learning more about SWR and all of the "mysteries" contained therin, as they say!
You might have done this already, but if not try entering "understanding SWR" in any on-line search engine and you will be surprised by the amount of good educational items it will return!
Here's a good one that I found very helpful:
http://www.arrl.org/tis/info/pdf/q1106037.pdf
Take care!

No it does not depend on a perfect cable unless you have a really really bad piece of transmission line, and in that case you should get rid of it. Standing wave ratio is the ratio of the maximum amplitude to the minimum amplitude of the standing wave. On an open wire, it is easier to measure with external instruments and of course the amplitude of the standing wave will vary along the cable and the SWR will be the maximum you measure divided by the minimum amplitude you measure.

Personally I have a vat of liquid nitrogen and prefer to use
super-conductors for my antenna systems. Of course my measuring
instruments are perfect and there is no room for error.

I guess it depends on what you think is "really really bad." The farther you go down the cable away from the transmitter, the lower the forward power will be due to attenuation in the cable. The closer you go to the transmitter, the lower the reflected power will be, again depending on the amount of attenuation in the cable. (Yes, I'm assuming a "good" cable, or even a "perfect" one, meaning the cable has [near] consistant impedance along its length at the given frequency, where the mismatch is at the antenna.)

So, the closer to the transmitter you measure the SWR, the lower it will be. A long enough "good" cable will attenuate essentially all reflected power, giving a SWR of 1:1, regardless of the mismatch at the antenna. Of course, the higher the frequency, the greater the attenuation will be in the cable, so the more the SWR will be lowered on a given length.

The 'better way' to measure SWR is to:

a) Ensure your coax is good. Measure the power into it with a dummy load at the other end and then measure the power out at the dummy load end. Compare what you get with the specs of the cable. Most (and this is very general) is that at 100mhz you will loose 3db for a 9913 or RG8 type of cable. You don't see that, then throw it away. Coax does get worse with age.

b) Take the time to understand the math on how dB works. It isn't hard and incredibly simple once you figure it out. Every 3db (+ or -) is either double or half. Go another 3db and you get to double or half it again (2x2=4). Go another 3db (to 9db) and you are now 2 x 2 x 2 or 8 times (either gain or loss depending on which way you were headed). Then you get to 10. Ten is 10 times loss or gain.

Test question (no need to blab the answer if you know it). How many times gain is +13db. You should be able to do this in your head. (all the above assuming power readings--please don't confuse every one with voltage readings at the moment).

c) Measure the antenna SWR at the antenna end. This will give you the most accurate reading of SWR. (notice the period)

d) SWR readings are over rated - Make sure you read 'Reflections'.

I never ever get excited until it starts to get well over 2:1.

The big question is why do you need a tuner anyway? (oh, that wasn't the question). Just fix the antenna to resonate correctly. Much less loss over all.

(flame suite on)

25822. FT-897D CAT commands for Ham radio Deluxe

Yahoo group: FT897 (2009)
Date: 2009-04-27 19:52:14 UTC
From: oceanbiz01
Topic: 25822 Message: 25822

I have HRD running with the 897D. I notice that the standard download of HRD displays some buttons and slider bars for some of the Menu items in the radio. But there are radio features that are not available in HRD. Someone on the HRD forum suggested that I look at the CAT commands in the 897D manual and then put the missing commands into HRD. However, it seems that the CAT command list in the manual is very limited. For example: There is no CAT command for VFO A=B. Also, there is no CAT commandfor CW 60, 120, 240 Hz. Also, I do not see CAT commands for the HRD slider bars such as VOX Gain, Mic Gain, PWR out put etc. The HRD screen has slider bars for these functions and they work fine, but I would like to see a complete list of CAT commands for the radio so that I can add to HRD those features that I would like to have available in HRD.

Can anyone here help? is there an expanded CAT command list available?

Dan K3ZXL

"Reflections" should be near the top of your list. ;-)
W6SAI's "HF antenna Handbook" is also a great book for one's library.

Hello Randy , and All.

I'm always ready to be educated,,, so I am following this thread earnestly..,,,,,,
Randy,,, can you clarify the math on this final statement ???
"" A long enough "good" cable will attenuate ,,,,,
essentially all the reflected power, ,,,
giving a SWR, of 1:1, regardless of the mismatch ,,,,,,
at the antenna"" ,,,,,
I am happy enough with 'the longer the cable, the greater the attenuation'
That statement, would hold good, at any frequency,,, but as you said,,, most noticeable , the higher the frequency used !!
Can you give an example , for say,,, 50 Watt TX,,, [145.00 MHz] from radio,,,,, and 10 Watts measured as reflected , with a meter [cross needle] at the back of the radio. [average VHF Co-ax] say ,,, 20 Meters of feeder ?... with the miss-match at the antenna ???

The part I cannot realise is,,,, If I measure 10 Watts at the radio,,, as reflected,,,,, How is this changed to zero ??? by attenuation ???
Sorry, - I just never heard that part before,,,, and am curious.... I know Vswr, means Voltage. swr.....
Thanks in advance ______ Peter EI4HX _._

Subject: [FT897] Rig Interface with AC Logger

I just bought a rig interface but cannot get AC logger to handshake with my 897d. does anyone use N3FJP's AC Logger with the 897d? what do I put in for "string to read frequency" and 'mode" what do I check off for "connection power" can someone walk me thru this please. I tried it using HRD and got a handshake so that logger recognizes my rig, but I like using AC Logger. please help me out. thanks, Herb K1LOG

Hi Adam, I have the right comm port. what are the settings you are using in AC Loggers "rig interface" page? did you use Yaesu 890 on the left of the screen? what did you use for connection power, parity,etc. Herb K1LOG

Here is what I use for AC Log:

Select Rig: Yaesu
Comm Port: (You select the right one)
Baud Rate (k): 9.6 (make it match Menu No. 019)
Parity: None
Data Bits: 8
Stop Bits: 2
Connection Power: RTS
Radio Polling Rate: 100ms (your choice)
Use Frequency: (check, but your choice)
Mode by: Rig (your choice)
Convert from Hex: (check)

73,
Steve - AA5TB
Fort Worth

I have read the message that indicated what someone's assesment of the marks mean. I cannot agree with it, but the math is good.

I built a 6 Meter antenna to use for the spring and have it up about 40 feet. It seems to accept power and gets good low marks on the 897D, However it does not agree with the reflected power on my Telewave Power meter. It agrees closely with the minimum swr, but the value of the swr is way off in both situations, and I don't know which to believe. The article on using the "marks" as an indication of reflected power vs. forward power is a good argument but it doesn't seem to hold any water when I test the marks against a known good 50/25/17 ohm load. When I put a good quality 50 ohm load on the 897D through the Telewave power meter, the 897D reads nothing on the swr meter, however the Telewave reads 1 watt with 50 out which translates to 1.33:1 swr with 50 W out. Not a good indication. When I parallel 2 50 ohm loads to make 25 ohms which should be 2:1 swr, I get 15 watts reflected on the Telewave which translates to 3.4:1 swr, and if I look at the 897D, I get 2.5 marks which should translate into 1.58:1 swr. [swr = ((1+(rp/fp))/((1-(rp/fp))] where rp = reflected power and fp = forward power.] So nothing seems to relate to real measurements. When I put 3 good 50 ohm loads on the cable for 17 ohms, it is even worse. I am still trying to come up with some way of really measuring swr or using my service monitor I have with a bridge circuit to compare to known resistances.

Final result is I cannot trust the reflected power I read from my Telewave power meter nor can I trust the "marks" I read from the 897D to give me a real indication of swr.

Topic: 25219 Message: 25831

Let's take an example of an antenna that has a 3:1 SWR, with a feedline that has 3dB loss, and a 100W transmitter.

At the transmitter end, we have 100W forward power. At the antenna end, we only have 50W forward power due to the 3dB line loss. The 3:1 SWR at the antenna results in 25% reverse power. Since 25% of 50W is 12.5W, that is how much reflected power is measured at the antenna. But, traveling back to the transmitter side, the reflected power faces the same 3dB loss that the forward power had. Therefore, only 6.25W makes it all of the way back to the transmitter. Instead of the 100W forward with 25W reverse we expected to see, we have 100W forward with 6.25W reverse. That is a much lower SWR, 1.67:1 according to one of the SWR calculators on the web.

If we look at the halfway point, we have 75W forward, and 9.375W reverse. That's an SWR of 2.09:1. Also, if you had enough loss in the cable, the ratio would go to 1:1, ignoring extra decimal places, when the reverse power at the transmitter dropped below 0.05W. (And that's ignoring the limits of the meter.) Looking at the above example should show that it wouldn't take that much loss to make a 3.0:1 SWR look like a 1.0:1. I think that it's something like 24dB loss one way. It takes a lot less loss to make it "close" to 1:1.

I realize that I may be simplifying this by ignoring reflections of reflections, but the concepts hold. The article mentioned earlier <http://www.arrl.org/tis/info/pdf/q1106037.pdf> mentions this somewhat in the section titled "Is that the Whole Story?" It's looking at it from the other side, though: if your cable loss is x dB and your SWR reads y, your effective SWR is z.

73,
kg4jix randy.

Subject: SWR @ !:!

Hello Randy and All

Thank you for the imaginative arithmetic solution.

Without using imagination, can you show the realistic math, for a real life 1:1 situation, for the example I asked for previously ???

20 M length of RG213 co-ax, dB loss for 100 M is 2.75 dB @ 150 MHz.
So 20 M long will be 0.55 dB line loss. Both forward and reflected.
Total line loss will therefore be 0.55 x 2 = 1.1 dB overall, attenuation.

Can you show us all how a transmitter with an output of 50 Watts, and showing a reflected power of 10 Watts
will arrive at a 1:1 SWR at the back of the radio.

Allowing the 10Watts of reflected power to disappear ???
What will the SWR at the antenna be,,,, if the SWR at the radio is in the proportion of 50W forward : 10 Watts reflected.

As in this case.....

25834. RFI problem with MH59 mike

Yahoo group: FT897 (2009)
Date: 2009-04-28 13:01:20 UTC
From: Lew Phelps K6LMP
Topic: 25834 Message: 25834

Hi, folks.

I got a new MH-59 mike for my birthday (very understanding father-in-law!). It seems to be a great mike, allowing you to remote control almost every aspect of the FT-897 from buttons on the mike, which is great for mobile use. Unfortunately, my mike seems to suffer from an RFI feedback problem that has been documented online -- when you key the mike on HF or 6 meters, an RF loop sets up so that the mike won't unkey when you release the PTT switch.

I have temporarily fixed this by slapping a couple of snap-on ferrite beads on the mike cable. Crude, but effective. I've read online about a simple mod, (http://www.ae7q.net/doc/public/MH-59.php) putting a 1/2" diameter ferrite core into the mike and wrapping the incoming wires one turn through the toroid. Has anyone tried this approach? Does it work for you?

I'm also considering another mod, described by W1AEX (http://members.cox.net/w1aex/mh59.html) to improve bass audio by adding several caps to the circuit board. Has anyone done that mod? How does it work for you?

Thanks and 73,

Lew K6LMP

HELLO TO ALL
  Yes, I am the new guy in the group. I am returning to HAM radio after a few years away so feel like a novice just starting as I did some 30+ years ago. Now live in Missouri.
  Some of the old ways are coming back as I build my station. I already have a 2M HT but anxious to get on the air. I hope to get some antenna work done this week. I look forward to the Group comments and tips on the FT-897 as I am seriously considering this radio for my new staion radio. Looks like some good sale pricing and rebates at the moment at the big dealers so may be the time to make the buy. Any suggestions.

Gary,

The CTCSS codes are included in the manual. As you probably already know, you just need to know the tone for your repeaters that you want to tune up and save. The FT897 I have is very easy to set-up for VHF repeater use. They give you step by step instructions in the manual.

Subject: [FT897] NEW MEMBER

HELLO TO ALL
Yes, I am the new guy in the group. I am returning to HAM radio after a few years away so feel like a novice just starting as I did some 30+ years ago. Now live in Missouri. Some of the old ways are coming back as I build my station. I already have a 2M HT but anxious to get on the air. I hope to get some antenna work done this week. I look forward to the Group comments and tips on the FT-897 as I am seriously considering this radio for my new staion radio. Looks like some good sale pricing and rebates at the moment at the big dealers so may be the time to make the buy. Any suggestions.

From: Randy Charles Ford
Topic: 25832 Message: 25845

I didn't use your numbers because you gave too much information. Stating the forward and reverse power at the transmitter, 50W and 10W, set the SWR at the transmitter. No math is going to change that, without changing some of the other parameters, such as cable length or loss.

This could be solved to see what the SWR is at the antenna, which may be helpful. Adding losses, by either extending the length of the coax, or by using higher-loss coax, would lower the measured SWR at the transmitter, but we generally work hard to avoid those losses. What is really important isn't even the SWR at the antenna: it's the amount of power that is being effectively applied to the antenna, so it can transmit it. That is the forward power at the antenna minus the reverse power. (Efficiency of the transmission system could also be useful, which would be the difference of forward power minus the reflected power, divided by the forward power at the transmitter.)

I commonly see people who appear to think that the goal of an antenna feed system is to have low SWR. It should be to have maximum transmitted power at the antenna, while keeping SWR low enough to not damage the rig. Adding losses to lower SWR generally would be a bad thing. Even adding a tuner to a system where the SWR is alrady "low enough" introduces losses in the tuner, and may result in less power reaching the antenna, even though it lowers the SWR measured at the transmitter.

Also, note that the loss in the system you described would be greater than 1.1dB, because the SWR is not 1:1 at the antenna. The figure given by coax manufactures assumes this, otherwise the figure would be useless. The ARRL article listed earlier is specifically design to help one understand the loss, sometime a huge loss, in the coax when the SWR is not 1:1. I believe that it may answer your question better than I can.

The reason I posted the first time was to show that the SWR at the transmitter is lower than the SWR at the antenna, due to transmission line loses. Also, the worse the loss, the better the SWR appears at the transmitter. If someone has an SWR that is much lower than their system should be, it is likely due to these loses. If the SWR improves suddenly, or slowly over time, the system likely has a problem. As coax deteriorates, the SWR is likely to improve!

I find it interesting that some antenna manufactures specify a minimum length of coax to use between their antenna's matching section and the transmitter. As far as I have figured it, they are doing that to use the shield of the coax as a transmitting element, or they are using the added loss to lower the SWR seen at the transmitter. Either way, it doesn't sound like something I want to try.

73,
kg4jix randy.

From: hb789
Topic: 25846 Message: 25846

Hi, I have an AT-897 tuner connected to my 897d. I've been trying to set up a rig interface to my computer. got it working last night but then this morning it wouldn't work. does menu 020, cat/lin/tuner have to be set to 'cat" it's now set at tuner, and will not change. It's stuck on 'tuner" any suggestions? I'm really, really frustrated with trying to interface y 897d with my computer. had it working with both AC Log and HRD last night, but neither would work this morning!!!

25847. Re: CTCSS CODES

Hi Gary et All in the group,

Welcome back to the hobby. I am also a recent returnee of 2 & 1/2 years or so. After weighing the pros & cons of the "Shack-in-a-Box" modern rigs I settled on an 897D and haven't looked back. Its a great deal & new prices are low enough to make the new\used question a moot point. I added LDG's AT-897 & FT meter and am happy with the results. I also run some old hybrids(Drake B-Line & TS-830) & the 897 compares very favorably with their performance with many digital enhancements to make life simpler. If you haven't already done so I'd advise going to the Yaesu site & downloading the manual. As others have mentioned the rig supports CTCSS tones and if the tone is unknown will even scan for it. This feature doesn't always work perfectly but when it does work it's a thing of beauty.

Good Luck in your quest for a new rig & happy listening and much DX,

Vy 73,
Mike

For what it's worth, I think you loss figures are off for RG-213- Quick look shows that your loss figure are approximately correct per 100 FEET, no meters.... so you would be looking at more like 1.7 or 1.8 db for the 20 meter run.

Then add your SWR losses from there.....

25849. Re: Menu 020

Yahoo group: FT897 (2009)
Date: 2009-04-28 23:53:01 UTC
From: John Bucsek
Topic: 25846 Message: 25849

This was just answered recently in another thread. It seems that the FT-897D gets stuck on "tuner".

Basically menu 020 needs to be on "cat". The "tuner" choice is for Yaesu's tuner. The LDG AT-897 tuning function is independent of the FT-897.

The other post mentions how to get the menu unstuck. I believe that when I made the same mistake all I did was unplug all the accessories from the FT-897 and turn it back on and set menu 020 back to cat without anything extra attached. Then I powered off again and reattached all the cables from the AT-897 to the FT-897.

25851. Re: [FT897] SWR @ !:!

Yahoo group: FT897 (2009)
Date: 2009-04-29 09:17:58 UTC
From: Richard Corfield
Topic: 25832 Message: 25851

I think it's easier to work in terms of return loss in dB because that just adds up with cable loss through the system. At least I used to think so and that is how I answered the exam questions, by converting to that form and doing it that way. Reading this makes me wonder how well I remember it all, so here goes and correct me if I'm wrong.

Return loss at the antenna (dB lost due to power reflecting back) = -20 log ((SWR - 1)/(SWR + 1))

For example SWR=2, so voltage reflection coefficient = (2-1) / (2+1) = 1/3, so return loss is 9.5dB. (-9.5dB of your signal, or 1/9th of it, is bounced back)

If the cable loss is 10dB, then the return loss from transmitter to antenna and back again would have gone through that cable twice so would be approximately 29.5dB. (or -29.5dB of your transmitted signal appears back at the transmitter as reflection)

This does not factor in reflections of reflections but I wonder how useful they are. They're not guaranteed to be in phase for a start. Also if the transmitter's output impedance, the impedance it looks like looking in from the cable, is 50ohm then surely it should absorb the reflected power rather than reflect it back. This would seem to make sense given that high SWR leads to blown finals.

The signal coming back to the transmitter from the antenna will be 29.5dB down from the outgoing signal, so we reverse the first equation.
The voltage reflection coefficient seen at the transmitter is 10 ^ -29.5/20 = 0.0335. Those standing waves have really shrunk!

SWR = (1 + r) / (1 - r) = 1.07.

It will never reach 1:1, but it will get closer to it as the cable gets longer.

Most of the power in this case is lost in the cable. This must be a really long or really bad cable. Maybe you're using RG58 to go to a rooftop antenna from your shack in the basement at 430MHz.

Power getting through to antenna via cable is -10dB = 10^-1 = 0.1, so 90% of the power is lost in the cable.
(check sanity, double the cable lengthy, -20dB = 10^-2 = 0.01, so 99%, makes sense)
Power not reflected is 1 - (-9.5dB) = 1 - 0.1 = 0.9
Power from transmitter to antenna is therefore 0.1 * 0.9 = 0.09.

So what of putting the tuner at the antenna end of the feed? I suppose we eliminate return loss completely but cable loss is still there. We can get a better match because we're matching to the "real" antenna and we're not lulled into a false sense of security by our 1:1.07 SWR reading. This system with its loss being mostly in the cable will still have the cable loss swamping the return loss.

- Richard

Hello Pat

I have looked at a couple of on line calculators for SWR / dB loss/ gain.
Best one I have found is www.coarc.ca/coax.htm

Yes you are right !

I seemed to be using imperial measurements,,,,
don't know when I worked in feet, and inches,,,,, years.

It really is an eye opener,,,
If you play around with the figures,,, you can really come up with genuine figures to correspond to show a 1:1 match ,,,,,,,,, the transmit power will have gone down into the ground,,, but the fact is,,,

Randy is right.!!!

So an educational gong to him for his endeavour.

I have saved the calculator in my "antenna / feeder" files, so it should be a saving on calculating on paper, in the future.
As I was always taught : The only stupid question, is the one nobody, asked !!!
Thanks to all for their attention.

As you set up each 2m freq for your area repeaters, program them into memory, also program the tones at the same time, THEN save the frequency into memory.

(One area repeater just added tone.)

If you do it as I first tried, had the repeaters saved in memory, then programmed in a tone... it worked that time, and I thought I had it saved, but as soon as I tuned away it lost the tone. Next time I used that repeater, no tone.

So, set it all up first, then save to memory.

But this radio does it all.

CTCSS subtones are useable on ALL bands in fm mode with full encode decode and with ctcss subtones reversed if reuired.

I myself find that programming the memorys is the easiest way on the FT897 using basic MMO memory managment software.

Topic: 25855 Message: 25855

I am currently controlling my 897D with HRD, and want to set up memory management software as well. I have the LDG AT-897 tuner, so I have an additional CAT port. I am not sure which software I am going to use yet, and I'm open to suggestions to that as well. My question, however, is about using memory management at the same time as HRD. Can I run both programs at the same time? If so, do any of the menu items need to be changed? Also, does memory management software use the CAT port, or one of the others. I'm sure this is being done, I just haven't been able to find the answer.

Thanks & 73,

You will only be able to run either HRD or the memory management software as both require the cat port for use.

Hello Hank

There is no necessity to run HRD and the memory management software at the same time as the memory management software simply stores the channel information and CTCSS codes etc. in your FT897D, it is only run to upload or download the channel information to or from your PC (you can have as many file versions as you want!). There after you simply press the V/M button on the top right of the FT897D and select the channel required using the MEM/VFO ch knob. I have 135 beacons, repeaters, satellite channels and simplex channels stored and available for use at a press of the proverbial button! One more press of the V/M button returns you back to where you were originally - maybe still in HRD listening to a net on 20meters.
The software I recommend is FTBasicMMO available for download at www.g4hfq.co.uk.
Enjoy!
Regards Allan M0CBG

25859. Re: Memory Management Software

Yahoo group: FT897 (2009)
Date: 2009-04-30 00:38:28 UTC
From: Hank
Topic: 25855 Message: 25859

OK, that makes sense. I want to use memory management software so that I can easily manage my memories. I will definitely give FTBasicMMO a try.

One last question; does FTBasicMMO use the CAT port? If so, can I plug it in the second CAT port on the LDG AT-897 tuner and leave it plugged in even if I am not using FTBasicMMO? I want to try to avoid having to swap cables around.

Thanks and 73,

Hank / KB4MTO

Nevermind, I just answered my own question. I will be using the same computer for both, so it will use the same cable.

Thanks for the info, I will be downloading FTBasicMMO later tonight.

You will only be able to run either HRD or the memory management software as both require the cat port for use.

GigaParts.com also sells a laminated "MiniManual" which is a quick reference for the radio. I don't leave home without it... It covers all of the essential functions and menu items. for when you're on the move.

Gary,

The CTCSS codes are included in the manual. As you probably already know, you just need to know the tone for your repeaters that you want to tune up and save. The FT897 I have is very easy to set-up for VHF repeater use. They give you step by step instructions in the manual.

Gary,

I HIGHLY recommend the 897/d. I'm a new Ham and it's my first radio. Just about everyone I talked to before my purchase recommended it. Can't beat it for versatility. Base, Mobile, Portable, Multi-Band, it does it all. Easy to setup and use. I was on 60m talking to the Bahamas the first night I had my General.

The jumper mod is a good idea as well. Gives you TX/RX capability in places it's restricted from the factory. I can mount mine in a vehicle and use it on ham bands and switch over to CB bands and drop the power if I want to talk to folks while on the road. Saved the installation of a second radio and antenna and bought a few extras for the 897/d.

The one thing I DON"T recommend is the Yaesu FC30 AutoTuner. Had one for 2 days and it bricked. It never worked the way it is advertised. Get the AT-897 from LDG instead. It's a much superior product at about 2/3 the price and it works better than advertised.

25864. Filters

Yahoo group: FT897 (2009)
Date: 2009-04-29 16:38:07 UTC
From: Randall
Topic: 25855 Message: 25864

I'm looking at getting a SSB InRad filter but can't decide on a 2.3 kHz 10 pole filter or a 2.0 kHz filter.

2.0 kHz seems a little tight. Would be used for PSK mostly.

Which would be a better buy ?

Thanks
Randall

25865. Re: [FT897] Memory Management Software

From: Redd Legg
Topic: 25855 Message: 25865

Hank,

This is good software for memory management. Works with other Yaesu radios as well.

http://www.gigaparts.com/store.php?action=profile&sku=ZYS-ADMS-4B

On sale for $22.50 plus shipping right now. I'm assuming you already have the CT-62 interface cable. If not there is a package deal w/cable for $49.50 at:

http://www.gigaparts.com/store.php?action=profile&sku=ZYS-ADMS-4B-KIT

  You cannot run HRD and ADMS at the same time as ADMS uses the cat port with the radio in clone mode. Although I have not tried it, I would assume that when you turn the radio off and back on in clone mode that HRD would not have a problem with it. It will just not "see" the radio until you turn it back on in normal mode.

From: blakatosh
Topic: 25866 Message: 25866

Hello,

I'm trying to decide on a new rig for mobile and fixed operation. In the shack I will be driving amplifiers on the 3 VHF band. Each amp has slightly different drive requirement. I was told the FT-897D has a problem with a large spike in power when going from receive to transmit ? I may also use the rig to drive up converters for the higher frequencies. Wonder if this is a wide spread problem with 897D's and is there a fix ??

Thanks in advance ! 73

25867. Digital Modes/FLDIGI

From: Ron
Topic: 25840 Message: 25868

Hi Gary,

Welcome back to Ham Radio and to the group. I am relatively new to this group also, and have come back to Ham Radio after about 20 years away. I feel the same way that you do, as so much has changed.

I just purchased an FT-897D a few days ago. I like the radio very much. It has many nice features and is very flexible. I'm mostly into CW. I would highly recommend the optional filters for this radio, as with any rig, the filters are what make the rig what it is. I especially like the smooth tuning of this radio which others lack. This will be a keeper for me. Also, I have found that the LDG FT Meter is a very useful accessory to me.

I would definitely consider the 897, and if you are not sure, try to use one somewhere. It will sell itself. Now is a good time to buy, as there is a rebate offered until the end of the month (I think). Good luck and have fun!

Regards,

Ron WB9BDZ

25869. Help pls - best location of 4m vertical and various vertical aerials ??

Yahoo group: FT897 (2009)
Date: 2009-04-29 21:40:16 UTC
From: simon.worsley
Topic: 25869 Message: 25869

Hi all

I have 4 vertical base station antennas:

Sirio CX-4-68 for 4m

6, 2 and 70 tri-band colinear for packet on 2 and 70 and occasional 6m chat

Diamond X-510N 2 and 70 which is my main antenna for 2 and 70 chat

Ten metre vertical

Currently these four antennas are on 4 seperate aluminimum pole masts.

I want to reduce it to preferably two masts maximum.

I think best to leave the ten metre antenna on one mast on its own? And I am thinking of installing the 4m antenna, the tri-band colinear and the X-510n all on one mast which is made up of a 20foot 16g aluminium pole, joined to a ten foot aluminium 16g pole which will be guyed at a couple of places for strength in the winds.

So, here is my question. What order should I install these three antennas considering I mainly use 4m FM for chatting, and the big X-510n for chatting and the tri-band for a bit of packet?

Can I get away with installing them on one mast? The thing I am worried about is each antenna interacting with the other. How far should the aerials be spaced apart?

I suggested making a T bar off the one mast to add three verticals spaced apart by 2 foot - but a couple of locals have told me not to bother and connect it all to one mast but the antennas will be literally touching each other which mustnt be a good thing even though they are all insulated by fibreglass tubing?

Any help much appreciated ??

Thanks and greetings from a proud 897d user in London,

73s Simon

25870. Will the 897 Do The Job?

Looking at picking up one of these radios but have a few question for all you long time users.
First off I want to use this for some satellite work, 2 meter and 440 FM and SSB modes, will this rig do that for me in cross band operation? I think it does 2 meter and 440 SSB as well as FM but getting that info seems tough to pull up. I looked at the manual and did not get the info on first read through
Will it work well with Ham Radio Deluxe? I guess there will always be some small issues but as a big time user of this software will the 897 connect and function properly?
Can I get good performance in crowded SSB situations or would I need a SSB filter? I know it's not a contest rig but like to cherry pick DX during the big ones
Have to sell my TS480HX first, then pick one up so thanks for any help

Jeff

Short summary. You get what you pay for.

The TS480 is a much much better radio. I know because I own both. The FT897 is a good radio, but more like a swiss army knife. Good at a lot of things, but not great at anything. If you want it for crowded 20M, the 480 is much better hands down. You could sell your HX and pick up a non-hx and use the difference towards a proper satellite rig.

It will be hard to do satellite ssb work if you can't hear your downlink. It is better if you can run full duplex.

You would be better off trying to find a used satellite radio (model numbers escape me at the moment). Yaesu did make a few of them.

It works great with HRD.

Hi Josh
I have an Acer netbook that is running Ubuntu UNR Linux - (a remix to suit the hardware - but otherwise an ordinary Linux). I use the standard cables to connect to my FT817/FT897 and the extra software that needs including is Hamlib which should be in your list of installable software. Try with standard cables first, at least you've not had to buy anything more then.

Once Hamlib is in - you can configure it via FLDIGI easily choosing the model of radio your using (897) and the port - I use mine via a USB to serial adaptor. It all just worked - but I appreciate thats not everyones experience. FLdigi will talk using other software interface but I've no experience of them.

I do have a Rig expert Tiny which is USB and use it long-term connected to my FT897nd and Windows XP box. I've had occasional goes at getting it to work with Linux (dual-booting the above) and some success - in that case it was PCLinuxOS with Hamlib installed. I'm no programmer - mores the pity, but Hamlib might be extended to talk to Rigexpert gear? Which would be nice.

Aside from FLDIGI which I think has the neatest interface, there is gMFSK which has similar capabilities and worth a play.

I'm away for the weekend and intend doing some QRP RTTY operation on 20m in the ARI DX contest with the 817.. the '897 stays home.

Hope that helps & 73s

Dave,
Thanks for the reply. I have one more quick question regarding how
you have the laptop and radio interfaced. Can you please expand on
what you mean when you say you are using "the standard cables"? What
ports on the radio are connected to the radio, just the CAT port or
just the Data port or both?

Thanks,
Josh Smith

IMO, the 897 is too big to use as a mobile. You may want to look at the 857 since it is the same radio only in a mobile package and works well as a base as well. The 897 is basically a base/PORTABLE rig. I have not heard about any power spikes with either radio, but someone else may be able to clarify.

Subject: [FT897] Power spike in Output of 897D ?

Hello,

I'm trying to decide on a new rig for mobile and fixed operation. In the shack I will be driving amplifiers on the 3 VHF band. Each amp has slightly different drive requirement. I was told the FT-897D has a problem with a large spike in power when going from receive to transmit ? I may also use the rig to drive up converters for the higher frequencies. Wonder if this is a wide spread problem with 897D's and is there a fix ??

Thanks in advance ! 73

I think for mobile one with a detachable face plate would be good.
Yeasu makes them too

Randall -

There would be no significant difference between running the internal filter and installing a 2.3 kHz filter. However, if you are an avid SSB operator, the 2.0 kHz filter would be the filter of choice.

Another advantage of the 2.0 kHz filter would be better performance on the digital modes.

If you're inclined to work CW...the 500 Hz filter would be a very wise choice.

Date: 2009-04-30 13:21:34 UTC
From: D. F.
Topic: 25870 Message: 25880

As Yaesu states, the 897 is an ALL BAND - ALL MODE radio. It does AM, FM, SSB, PAKET, PSK 31, CW, and basically all digital modes. It DOES NOT, however, do CROSSBAND. It DOES have SPLIT FEQUENCY capabilities, which MAY be ok for satellite work, but the Doppler Shift would probably need to be done manually. Yes, you can TX on 2m and RX on 70cm in split mode or vice versa. You CAN SPLIT FREQUENCY ANY 2 bands you want.

It will work and connect just fine with HRD.

As far as "crowded SSB" goes, it really doesn't matter what radio you use. A crowd is a crowd. You will still hear everyone keying over each other.

Jeff

Short summary. You get what you pay for.

The TS480 is a much much better radio. I know because I own both. The FT897 is a good radio, but more like a swiss army knife. Good at a lot of
things, but not great at anything. If you want it for crowded 20M, the 480
is much better hands down. You could sell your HX and pick up a non-hx and
use the difference towards a proper satellite rig.

It will be hard to do satellite ssb work if you can't hear your downlink.
It is better if you can run full duplex.

You would be better off trying to find a used satellite radio (model numbers
escape me at the moment). Yaesu did make a few of them.

It works great with HRD.

Subject: [FT897] Will the 897 Do The Job?

Looking at picking up one of these radios but have a few question for all
you long time users.
First off I want to use this for some satellite work, 2 meter and 440 FM and
SSB modes, will this rig do that for me in cross band operation? I think it
does 2 meter and 440 SSB as well as FM but getting that info seems tough to
pull up. I looked at the manual and did not get the info on first read through
Will it work well with Ham Radio Deluxe? I guess there will always be some
small issues but as a big time user of this software will the 897 connect
and function properly?
Can I get good performance in crowded SSB situations or would I need a SSB
filter? I know it's not a contest rig but like to cherry pick DX during the
big ones
Have to sell my TS480HX first, then pick one up so thanks for any help

The 857 HAS a removable faceplate, AND, depending on where you buy it,
you CAN get the faceplate mounting kit included (usually no extra cost).

From: George
Topic: 25839 Message: 25882

I totally agree with your statement about the great radio, but keep in mind what your doing is illegal. The FT897 is not type accepted by the FCC for the 11m CB band whether you crank down the power on the radio or not. That is why the factory settings don't allow you to transmit there.

The FC30 tuner works okay for what it is, but you can get much better tuners of the same or lesser price that do a much better job. I would never recomend it.

Back to the original question, the tones are available. I would suggest you look at the manual for the radio (available as a pdf on this site or thru Yaesu's web site) to get a little better idea what it is able to do. There are other radios with a lower noise floor, with more power, with better DSP's, etc but when you put them all those radio's together and compare features and prices I dont think there is a better all around radio in its price range.

Base, Mobile, Portable, Multi-Band, it does it all. Easy to setup and use. I was on 60m talking to the Bahamas the first night I had my General.
>
>   The jumper mod is a good idea as well. Gives you TX/RX capability in places it's restricted from the factory. I can mount mine in a vehicle and use it on ham bands and switch over to CB bands and drop the power if I want to talk to folks while on the road. Saved the installation of a second radio and antenna and bought a few extras for the 897/d.
>
> The one thing I DON"T recommend is the Yaesu FC30 AutoTuner. Had one for 2 days and it bricked. It never worked the way it is advertised. Get the AT-897 from LDG instead. It's a much superior product at about 2/3 the price and it works better than advertised.

From: George
Topic: 25855 Message: 25883

I have not run filters myself, but from all the reports I have heard/seen on this site the 2.3 filter does not give much benefit beyond what is available in a stock non-filtered radio. Most people that have installed it say it is probably not worth the price. The 2.0 filter however does give a noticible gain over what is available without it according to most. Some people still question its worth compaired with price, but atleast you are getting an improvement with it.

Hi Josh
The 2 cables I use include one which goes to the soundcard in and out and plugs into th DATA port (which I think I made from a computer mouse cable). The other is the serial cable which plugs into the ACC socket and was bought.

Be sure to checkout the manual page 36. If you've not got it..
See..
http://www.scribd.com/doc/8739123/Yaesu-ft897-manual
Amongst others.

There are probably other ways to go about this - like using the Mic socket.

73 de Dave H G0CER

25887. One more time, how to use the MH-36 with 897

Yahoo group: FT897 (2009)
Date: 2009-05-01 00:01:26 UTC
From: tenorman1952
Topic: 25887 Message: 25887

I've found the MH-36 to be a waste of buttons, at least with my FT-897.

People keep telling me I can program some of the buttons, but for the life of me, I can't find anything telling me how.

All I've been able to get from Yaesu is a diagram of the mic with labels of what the buttons are supposed to do. Neither that nor the FT-897 manual are of any help. The 897 manual's only mention of the MH-36 E8J is the listing of it as an available option on page 3. It is also listed as an option on page 3 of the FT-897D manual.

The FT-897 manual, page 61, uder Menus 68, 69, 70 says:

MENU MODE
No□068 [PG ACC]
Not available at this time.

MENU MODE
No□069 [PG P1]
Not available at this time.

MENU MODE
No□070 [PG P2]
Not available at this time.

The FT-897D manual, page 61, under Menus 68, 69, 70 says:

MENU MODE No□068 [PG ACC]

Function: Programming the optional MH-59A8J microphone's [ACC] button assignment.

Available Values: All Multi Functions, all Menu Items (except Menu #065 through 070), MONI, Q.SPL, TCALL, ATC and USER.
Default: MONI

MENU MODE No□069 [PG P1]

Function: Programming the optional MH-59A8J microphone's [P1] button assignment.

Available Values: All Multi Functions, all Menu Items (except Menu #065 through 070), MONI, Q.SPL, TCALL, ATC and USER.

Default: Q.SPL

MENU MODE No□070 [PG P2]

Function: Programming the optional MH-59A8J microphone's [P2] button assignment.

Available Values: All Multi Functions, all Menu Items (except Menu #065 through 070), MONI, Q.SPL, TCALL, ATC and USER.

Default: TCALL

Now, this is interesting, but the MH-59 is NOT listed as one of the available options, but the MH-36 is, in both the 897 and 897D manuals.

On the other hand, the similar MH-48 with my Yaesu FT-2800M does all kinds of neat tricks. I just can't get the MH-36 to do the same with the 897. Makes me wonder why they even sell that mic for the 897.

I picked up a MH-31 and use that now with the 897.

Paul
AE5JU

Paul,

Press F key to get in to Menu Mode

Go to Menu 1

Make sure Extended Menus are ON

Go to Menu 65

Using the VFO knob, select the function for the button

Repeat for Menu items 66 - 70 where your mic has the applicable button.

You're done...

(I have the 59 so I don't know what buttons you have)

MENU MODE No•069 [PG P1]

Function: Programming the optional MH-59A8J microphone's [P1] button assignment.

Available Values: All Multi Functions, all Menu Items (except Menu #065 through 070), MONI, Q.SPL, TCALL, ATC and USER.

Default: Q.SPL

MENU MODE No•070 [PG P2]

Function: Programming the optional MH-59A8J microphone's [P2] button assignment.

Available Values: All Multi Functions, all Menu Items (except Menu #065 through 070), MONI, Q.SPL, TCALL, ATC and USER.

Default: TCALL

Now, this is interesting, but the MH-59 is NOT listed as one of the available options, but the MH-36 is, in both the 897 and 897D manuals.

On the other hand, the similar MH-48 with my Yaesu FT-2800M does all kinds of neat tricks. I just can't get the MH-36 to do the same with the 897. Makes me wonder why they even sell that mic for the 897.

I picked up a MH-31 and use that now with the 897.

25890. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: 2009-05-01 07:51:23 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 25890

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

Hi all,

Does anyone know of a replacement fan for the FT-897D that runs quieter than the stock fan? When mine comes on in xmit the noise 'blows me away' ;). I used to have an FT-450 which you couldn't even hear the fan.

TIA

From: Dr Mark Vaughan
Topic: 25893 Message: 25894

It's because they need a high air flow through a small fan, that is always going to be noisy, and this fan is pretty small.

There may be a slightly quieter fan, but usually the biggest noise drop happens due to less air flow and that would be bad for the radio, in some machines you can use variable speed so it's quiet if the radio's in a cool place, but this radio tends to get pretty hot even with its fan so I don't think there's much margin to be had there.

If it was an 857 you could remove the head, plug in an external speaker and put the radio body somewhere you can't hear it.

You may find that the location you sit the radio is reflecting some noise back at you perhaps from the wall behind which a softer finish for like foam (but don't block the vents might ease the noise, there are also sound deadening baffles for larger fans but I've never seen them on fans this small.

Swapping for another fan though could be risky, data for fans varying wildly with air speed volume etc. minor changes of which have no change with some heat sinks and massive change with others. This can mean that sometimes a slower air flow is better since there is more time for the heat to transfer to the air and less surface turbulence which tends to acts as an insulative barrier. You could experiment here but be careful you don't fry the radio.

The only other option is going to be a complete redesign of the thermal cooling system and that's going to result in a bigger radio, less noise = slower air flow = bigger heat sink etc etc., big enough heat sink and you won't need a fan.

The safest way may be to put up with it

Mark,

Thanks for the descriptive answer, I was afraid that was the case but thought maybe someone had come up with a quieter fan.

In my case the back of the radio is about 11-12 inches away from the wall but plenty of air circulation on each side, of course that amplifies the sound. Guess I'll have to live with it or maybe knock a hole thru the wall into the bathroom behind it.... naw guess that wouldn't work either. :-D

25898. how to receive while keying

Yahoo group: FT897 (2009)
Date: 2009-05-02 14:38:16 UTC
From: Tony Bradshaw
Topic: 25898 Message: 25898

Elmers,
Can anyone tell me how to set up the FT897 so that it will allow me to still receive (being able to hear what is on frequency) while I am transmitting CW? That is, if this is even possible...? Said another way, if I hit the key, I will still be able to hear another keyer at the same time. Right now, when I key, the sound goes silent and I'd prefer to just continually be able to hear what is happening on frequency.

25900. RE: [FT897] Filters

Yahoo group: FT897 (2009)
Date: 2009-04-30 14:50:23 UTC
From: Randall
Topic: 25855 Message: 25900

Edited for typo.....

I'm looking at getting a SSB InRad filter but can't decide on a 2.3 kHz 10 pole filter or a 2.0 kHz filter.

2.0 kHz seems a little tight. Would be used for ssb.

Which would be a better buy ?

Also, are the filters for the FT-817 interchangeable with the 897 ?

Thanks
Randall

I WRITE IN CAPS BECAUSE I HAVE VISION PROBLEMS.

I HAVE A ICOM 7000 FOR HOME USE,BUT WANTED A SECOND RIG TO BE PORTABLE.

I BUILT A ELECRAFT K1 2 YRS AGO.
ITS GREAT FOR THE BEACH OR ANY WHERE,BUT IT WAS FOR MY FAVORITE MODE CW.

THE FT-897D WAS VERY NOISY COMPARED TO THE K1.
I INSTALLED W4RT'S SSB FILTER AND HIS MOST NARROW CW FILTER.
NOW MY 897D IS NOT DESTROYING MY EARS.

I USE A HEIL HM-10 DUAL MICROPHONE.
THE #5 ELEMENT WORKS BEST FOR ME.

I USE A VIBROPLEX BRASS RACER FOR CW.

I ADDED THE LDG LARGE ANALOG WATT METER.
ITS A GREAT ADDITION.

IM GOING TO ADD THE TWO BATTERIES LATER BEFORE BEACH TIME.
IM SURE RUNNING 5 WATTS WILL CONSERVE BATTERY POWER.

I HAVE SEEN IN QRP MAGIZINES THAT HAMS HAVE BUILT CARRYING CASES AROUND THEIR TRANCEIVERS.
I AM GOING TO BUILD ONE AROUND MY FT-897D.

I HAVE NEVER PURCHASED AN HF ANTENNA,HOWEVER I HAVE LOOKED AT THE PAR ENDFEDS.
JUST TRIM THEM AND NO TUNER NEEDED.

I WILL HAVE SPENT WELL OVER WHAT MY ICOM IC-7000 COST, AFTER I ADD ALL THE ACCESSORIES TO MAKE THIS FT-897D PLEASE ME.

THE 897D IS FOR TAKING OUTSIDE AND HAVING FUN.
IT IS ALSO A GREAT HF RIG FOR HOME WITH THE FILTERS INSTALLED AND A MICROPHONE THAT COMPLIMENTS YOUR VOICE.

HAVE FUN WITH YOURS, CHUCK "N4UED"

This really amazes me. I have a 897D purchased 4/08 and have never noticed the fan being noisy. I have a friend who has an older one and and it too is not annoying. Sure I can tell when it comes on. However, I can tell when the fan comes on in my 990, FT-450 and other radios.

Perhaps I am not hypersensitive to noise?

My laptop fan makes more noise than my 897D.

Really odd...

Craig

Chuck, how are you measuring your output power? Bear in mind that you will need a peak reading meter to measure the actual output of SSB, since there is no carrier.

There have been many discussions regarding this on this list in the past. You may want to search through the archives.

This has been a subject on the board repeatedly. You will NOT see 100 watts on the wattmeter in SSB mode, even when the transmitter is operating normally.

Because SSB does not modulate 100% except at peaks, and far less than that most of the time, your average power output in SSB mode will show as 20 to 30 watts on the power transmit indicator. Try humming loudly into the mike and you will see a higher reading, but not 100 watts. It's normal.

25909. PL Tones

Yahoo group: FT897 (2009)
Date: 2009-05-03 01:35:32 UTC
From: Danny Loyd
Topic: 25909 Message: 25909

Have a question about the PL tones for VHF repeater. One of the repeaters I work recently changed the PL tone to 203.5. I changed the tone according to the instructions. The tone on the radio shows at 203.5, but when I try to talk on the repeater they tell me I am not breaking the repeater. One person on the repeater picked me up simplex and told me it sounded like I was transmitting on 206.5 instead of 203.5.

The question is, how do I ensure the PL tone is putting out the right frequency?

Thanks in advance,

Danny Loyd

At 12:55 PM 5/2/2009 +0000, you wrote:

how old is your radio Lou ? maybe the fans or one of then is/are starting get
bearing noise and just need standard replacement ?
My 897 is 3-4 yrs old and you can hardly hear the fans in TX mode. If I
listen
carefully I know its on. They are are the original factory installed fans.
I also have a mate's 897 here for repair and the fans on it are pretty
quiet too
even with the cover off the radio

cheers

25912. Re: One more time, how to use the MH-36 with 897

Yahoo group: FT897 (2009)
Date: 2009-05-03 05:02:39 UTC
From: tenorman1952
Topic: 25887 Message: 25912

Well, what this is all about, everyone tells me how to program three buttons. That's not the problem. I just wanted to operate the RADIO with the mic buttons.

I have a FT-2800M. The 2800's manual clearly states how to use the MH-48, which is quite similar in appearance to the MH-36. But unlike the MH-36/FT-897, the MH-48 actually works.

Trying the same commands with the FT-897 and MH-36 does not. Nowhere in the FT-897 or FT-897D's manuals do they tell you how to make the MH-36 (or MH-59) work the radio, only how to program three buttons.

Sorry, guys, thanks for the suggestions, but I gave up and traded the mic off.

Friend, it is not a matter of your microphone at all. Even with 50 watts shown on a watt meter you probably overdrive the transceiver and cause a lot of distortion and splatters, Remember your radio lessons, SSB power output is the peak to peak power of your radio during voice transmission, the power shown on your watt meter should be between 25 and about 40 watts for a full power output of 100 watts. In CW mode of course you will see 100 watts power output. In am you have only 25 watts shown but your real power output will still be 100 watts but mostly will be in your sidebands which do not show up on a watt meter.
Remember your radio theory or look it up and you will understand what I am talking off.

HAS ANYONE HAD ANY PROBLEMS WITH THE HAND MICROPHONE OR ANY OTHER MICROPHONE NOT DRIVING THE TRANCEIVER TO 100 WATTS OR CLOSE TO IT ON SSB.

I HAVE TRYED DIFFERENT SETTINGS AND IN NO WAY WILL THIS 1 WEEK OLD 897D DRIVE PAST 50 WATTS?

ANY IDEAS OR DIFFERENT MICROPHONES.

THE ONLY OTHER MICROPHONE I HAVE USED IS THE HEIL HM-10 DUAL.

Jurgen is absolutely right.

Every Field Day we have to keep a continual eye on the SSB station because some idiot sees 30 watts output and takes it upon his (uneducated) self to max the MIC gain.

New amateurs would be well-served to learn amateur radio from knowledgeable hams in their local radio club rather than from a book or off the Internet.

I'm also amazed at the number of SSB operators who refuse to follow their Owner's Manual instructions to adjust the MIC gain for minimum ALC. Unless they see a wildly swinging meter needle or a full bank of blinking LEDs, they're just certain there has to be something wrong with their transceiver.

Hi Chuck !

You now have 2 good reasons to believe what you are being told.
This same thread has come up, several times before,,,
It would seem you did not take advantage of the many previous posts in the history files, on this subject.
It is a regular question, on many radio groups, from "operators", starting off, with a new, 1 week old radio.
It would seem you learned and memorised all the answers,,, but forgot the questions.
best 73,,, and better luck with your next radio.

Subject: [FT897] how to receive while keying

Elmers,
Can anyone tell me how to set up the FT897 so that it will allow me to still receive (being able to hear what is on frequency) while I am transmitting CW? That is, if this is even possible...? Said another way, if I hit the key, I will still be able to hear another keyer at the same time. Right now, when I key, the sound goes silent and I'd prefer to just continually be able to hear what is happening on frequency.

From: Tate Antrim
Topic: 25893 Message: 25920

Just got an ft897D this week from gigaparts.

This is my first all solidstate rig. I normally run kenwood hybrids and my biggest issue with the 897D has been the lack of plate and load controls! For the money I have to say wow. It has been a real pleasure to run on psk31 without the other station having to "follow" me. It is great fun to run with HRD too. Fortunately I don't have to run a tuner anywhere on my favorite operating bands (160m, 40m, 20m) though I have one if need be so the instant band switching is spoiling me. It is also amazing how small the radio is compared to the kenwoods

I haven't used it on ssb yet - pretty much just digital modes but it has been great. Highly recommended by me.

I'm seriously thinking about selling my kenwood hybrids collection now.

Subject: Re: [FT897] Quieter Fan for 897D

This really amazes me. I have a 897D purchased 4/08 and have never noticed the fan being noisy. I have a friend who has an older one and and it too is not annoying. Sure I can tell when it comes on. However, I can tell when the fan comes on in my 990, FT-450 and other radios.

Perhaps I am not hypersensitive to noise?

My laptop fan makes more noise than my 897D.

Really odd...

Craig

Northern Tools sells a 14 watt portable solar panel that I use to charge the batteries on the fly. You have to purchase a charge controller and make a cable to mate with the battery. It charges one battery in just about the same amount of time it takes to deplete the other.

The 123's are high dollar batteries and I've not seen a rechargeable yet.

Jim, I added the BHI, Inc 1061 module purchased from W4RT and it is absolutely amazing.

I have sound file in my AE5JU folder in the Files section. In the AE5JU folder in the Photos section I showed where I mounted the button for it, where the A/B internal battery switch had been. Some people don't like that, but I never intend to run from internal batteries. I have the FP-30 power supply, and when I do run from batteries, I use far larger than will fit inside. And I can remove the DSP button and snap the A/B battery button back in place. A totally reversable procedure.

For those that don't want to do surgery, W4RT has other BHI products, such as the ANES external DSP.

After using the BHI DSP I can't imagine using the radio without it.

Paul

Chuck

Please take the time to understand the difference between Peak Power (PEP) and Average Power. There are many many web pages that discuss it. This page discusses it for Amateur TV, but it is 100% the same story: http://www.hamtv.com/ampsetup.html

If you are getting 100w in CW into a dummy load, then you are good to go.

Make sure you understand your ALC and how it works in SSB. It needs to be set correctly. The manual describes it very well.

If you can, try to avoid typing in caps. Even going 100% lower case is easier on the eyes. J

It is 100 watts Peak, the average will be much lower and will depend on your voice charicteristics. The rig is ok

I'd rather not do the surgery, but an external one would be good it it
is small enough to keep the rig portable. I had trouble listening to it
for any length of time, so I bought a IC 746pro and there is a world of
difference between the two. I still have the 897d because it is smaller
to take to a lark in the park or things like that.

And I might add that if he wants 100 watts ssb, then he needs an
external amplifier that will put out about 400 watts

Hi - for a little bit more you might care to consider:

http://www.batteryspace.com/index.asp?PageAction=VIEWPROD&ProdID=1780

LiFePO4 offers very good power/weight/self discharge characteristics compared to NiMH.

For ordinary speech the average power is considerably less than the peak power, and depends on how loud you talk and your voice characteristics. for a trasnmitter that puts put 100w CW, 25 to 50 watts ssb is about what you can expect on the wattmeter, so if you want 100 watts, you will need about a 400 watt amplifier

That is wrong, completely wrong.

If the transmitter is like the FT897 or many others, it is capable of
100W maximum or peak output. that is 100W on FM and most digital modes,
100W peak (key down) on CW, 100W PEP (Peak Envelope Power) on SSB and AM.

That the typical power meter is not capable of correctly reading that 100W
PEP is totally irrelevant.

Try an experiment. Set up your transmitter and adjust it to give 100W key
down on CW. By this, I mean using the key to generate one long dash.
Then transmit a long succession of dots, what does your power meter read?

The problem is in the power measurement, not in the transmitter.

I agree with Geoff this is wrong.
An Ave power meter will measure 100W CW/FM due to the Tx being driving by a single carrier however on ssb the voice is made up of different frequencies so the power meter "looks" as the range of "carriers" ie 300 - 2k7Hz and avegages these out to say 25% of the transmitted power. to prove this on ssb whistle the rhe rig up with a single tone (whistle) and the meter will read 100W.
a peak reading meter will take the range and indicate the true peak power because of the time constant of the design of the circuit (ie a cap) which holds the peak voltage and drives the meter to the peak reading.
hope this helps to clarify this.
(btw to use a 400w amp to read 100w would give a peak power of at least 400W!)

Thanks

With respect, I don't think you understand theory or practice, at all.

Tell my why you think that a 100W PEP output stage doesn't give 100W PEP -
assuming that it is working properly.

What I am saying is a rig that put s out 100 watts PEP will only have
50 watts or less average power because of the characteristics of your
voice. Well, not yours in particular, anyone's, and the meter may
bounce around 25 watts, and you could still be putting out 100 watts
peak. A peak reading meter or an oscilloscope will show the 100 watts peak

Topic: 25902 Message: 25943

I believe it is correct. We are NOT talking CW or AM or FM (that was just mentioned as an example). The question was in relation to SSB. And, YES, the PEAK output in SSB will depend on your voice. The radio, while CAPABLE of 100w on SSB, usually never gets to full output because your voice is "usually" not strong enough to drive the radio to 100w. If you key the mic and whistle or put a tone into the mic, you would get close to, if not a full, 100w reading. But because the human voice has many "peaks and valleys" (on an oscilloscope), your voice is NOT strong enough to drive the radio to 100w. Remember too, there is NO CARRIER on SSB. What drives the power, therefore, is your voice.

So, to get a full 100w out in SSB - WITH YOUR VOICE - you will need an amplifier. How strong, offhand, I do not know, but it would need to be much more than 100w.

Dennis - N8BMB

That is wrong, completely wrong.

If the transmitter is like the FT897 or many others, it is capable of 100W maximum or peak output. that is 100W on FM and most digital modes, 100W peak (key down) on CW, 100W PEP (Peak Envelope Power) on SSB and AM.

That the typical power meter is not capable of correctly reading that 100W
PEP is totally irrelevant.

Try an experiment. Set up your transmitter and adjust it to give 100W key
down on CW. By this, I mean using the key to generate one long dash.
Then transmit a long succession of dots, what does your power meter
read?

The problem is in the power measurement, not in the transmitter.

Topic: 25902 Message: 25944

Sorry but on SSB YOU ARE driving it 100w
Look on a scope or Peak power meter and it will PEAK at 100w O/P Pep (Peak output Power). The standard analogue power meter in the shack is an aveage reading meter and due to the time constant of the meter does not read the PEAK power
If you transmit on SSB with a single tone an Ave meter will read 100w. Drop to two tones the power meter will read the ave of F1 + F2 thus 3dbs down ie 50W change to a human voice talking into the mic, there are many frequencies so the PEAK reading will still be 100W but the Ave reading will be around 25-40w due to the meter "seeing" several frequencies thus indicating an Ave power.

Thats why you should use a PEAK reading meter and or scope to prove the power is 100w.

Thanks

I believe it is correct. We are NOT talking CW or AM or FM (that was just mentioned as an example). The question was in relation to SSB. And, YES, the PEAK output in SSB will depend on your voice. The radio, while CAPABLE of 100w on SSB, usually never gets to full output because your voice is "usually" not strong enough to drive the radio to 100w. If you key the mic and whistle or put a tone into the mic, you would get close to, if not a full, 100w reading. But because the human voice has many "peaks and valleys" (on an oscilloscope) , your voice is NOT strong enough to drive the radio to 100w. Remember too, there is NO CARRIER on SSB. What drives the power, therefore, is your voice.

So, to get a full 100w out in SSB - WITH YOUR VOICE - you will need an amplifier. How strong, offhand, I do not know, but it would need to be much more than 100w.

If you want to measure PEP with a standard meter, you need a dual tone generator.

You may have something kicking around the home that can do this, many of us used to have home answering machines and before phones were DTMF when they were still pulse dialling we were supplied with a little hand held device with a telephone keypad that made the tones to access the answering machine.

These work quite well over the mic to give a full PEP envelope so a simple averaging meter will read the PEP value, some people can get away with whistling to achieve the tones, simply you need two tones that are not harmonically related.

Friends . . .

I think we have lost sight of the original posting which dealt with someone's concern that his new FT-897's meter was only showing 30 watts output on SSB. Somehow the discussion got sidetracked into theory and oscilloscopes.

A typical transceiver's output meter will INDICATE approximately 30 watts output for the typical human voice even though the rig itself is rated 100 watts PEP output. Assuming the use of a decent microphone, increasing the MIC gain beyond the ALC level indicated in the owner's manual will usually create distortion and IMD products.

That was all that several of us were attempting to explain to the original poster.

DE N7UVL,
I don?t know what they use these days, but the Military used to use a 2 Tone Test Generator. As with the previous advice given though, even that would not quite reach the Peak output reading.
-Note: to my way of thinking, a clean signal is better than a max signal. So be careful of the ALC setting so the signal does not splatter or become distorted./ga

Hi Jim,

Yes, that is correct, but you (should) always state the power output from
a SSB system as Peak Envelope Power. The "Average Power" is meaningless as
a measurement because it depends on the baseband information being
transmitted. For example, if there is a pause, then the average goes down
to nearly 0W, thenas the operator knocks his cup of tea over it goes up to
100W, first the crash of the cup, followed a second or so later by the
operator's curse has the hot tea reches his nether regions. One presumes
that the ALC will take care of anything that tends to exceed 100W.

Yes a suitable oscilloscope will show PEP, as will a !proper! peak reading
wattmeter.

Sorry but wrong Dennis.

The Peak Power rating of an amplifier is a design parameter. As it is a Linear amplifier, the output is determined by the input drive level (at least up to the capabilities of the amplifier) the way to increase the output is by increasing the microphone gain (but don't do this).

The problem with increasing the mic gain is that signal peaks will overload the amplifier and cause splatter. A signal processor, if used correctly, will compress the peaks and increase the average power of the signal, the ultimate case is constant amplitude or infinitely compressed SSB, which has no amplitude component. In this case, the average power will also be 100W.

What you will not need is a higher power linear, which is what I presume you mean.

That is not quite correct, a 2 tone input will give 50W average power, (assuming that the PEP is 100W). An average reading power meter will read an even lower value, Bird quote 40.5W for a Model 43.

The only way to get an average reading meter to display the PEP with ssb is to use a *single* tone.

True
When we were testing commercial transmiiters at Marconi, we used to set the AF single tone signal on SSB until we measured the full PeP (ie 50kW), reduced the single tone by 6dBs and changed to two tones and the Tx power meter (Ave reading) indicated half power whilst the Power measured in the dummy load was the full PeP.

Thanks

That is not quite correct, a 2 tone input will give 50W average power, (assuming that the PEP is 100W). An average reading power meter will read an even lower value, Bird quote 40.5W for a Model 43.

The only way to get an average reading meter to display the PEP with ssb is to use a *single* tone.

Very well said Kent, the point that you omitted was to say was that the
rig could have been giving 100W Peak output whilst !indicating! 30W.

This has been explained repeatedly (perhaps monthly) in this group.
Perhaps the theory between average and peak power should be part of the
licence examination in the USA.....

From: Chris Baker
Topic: 25902 Message: 25955

Folks,
Reading and exchanging mails, Im getting the idea that the confusion comes from people who have entered our hobby from other related radio hobbys where they are used to seeing on the meter a carrier of the full power(FM) or a low carrier which when modulated peaked to the full power (AM).
Hence the idea of another amplfier?

being an old codger who came into this hobby during the change over from AM to SSB on our HF bands, I had this problem too.

Once I had been trained as a Transmitter Enginner and gained my degree I understood the meter readings and difference between AM/FM & SSB readings against the measured power in a dummy load using a RF Voltage meter and using Ohms law to calcuate the power confirmed by a scope!

I think thats why MFJ (and other makers are out there) have meters which indicate both Ave and peak power.

Hopefully we have explained the readings to the gentleman who asked the question now and he has not gone away even more confused!

Maybe we can move on?

Thanks

I had a few failed attempts to tune a kite antenna at 40m. Must have
been close to half wavelength. I tune on fm at 5w as that gives me a
carrier. Testing after into dummy load with power set to 5w i see 1w
on the meter. Set to 10w i see the full 10w.

Kite was too unstable to allow me to make a contact. Recieved really
well making tuning on recieve by looking for strongest signal hard.
Tuner seemed quite insensitive to all but wildest changes. On 80m
tuned much better.

Thx M0RJC/P

Chris is right, with two tones modulation on an SSB signal, you can use an average meter to measure the PEP, but I failed to mention it is half the actual pep power value (or 3db down).

Thanks Chris

If you want to measure PEP with a standard meter, you need a dual tone generator.

You may have something kicking around the home that can do this, many of us used to have home answering machines and before phones were DTMF when they were still pulse dialling we were supplied with a little hand held device with a telephone keypad that made the tones to access the answering machine.

These work quite well over the mic to give a full PEP envelope so a simple averaging meter will read the PEP value, some people can get away with whistling to achieve the tones, simply you need two tones that are not harmonically related.

Subject: RE: [FT897] TRANCEIVER WILL NOT DRIVE CLOSE TO 100WATTS ON SSB.

I believe it is correct. We are NOT talking CW or AM or FM (that was
just mentioned as an example). The question was in relation to SSB.
And, YES, the PEAK output in SSB will depend on your voice. The radio,
while CAPABLE of 100w on SSB, usually never gets to full output because
your voice is "usually" not strong enough to drive the radio to 100w.
If you key the mic and whistle or put a tone into the mic, you would get
close to, if not a full, 100w reading. But because the human voice has
many "peaks and valleys" (on an oscilloscope), your voice is NOT strong
enough to drive the radio to 100w. Remember too, there is NO CARRIER on
SSB. What drives the power, therefore, is your voice.

So, to get a full 100w out in SSB - WITH YOUR VOICE - you will need an
amplifier. How strong, offhand, I do not know, but it would need to be
much more than 100w.

Dennis - N8BMB

That is wrong, completely wrong.

If the transmitter is like the FT897 or many others, it is capable of
100W maximum or peak output. that is 100W on FM and most digital modes,
100W peak (key down) on CW, 100W PEP (Peak Envelope Power) on SSB and
AM.

That the typical power meter is not capable of correctly reading that
100W
PEP is totally irrelevant.

Try an experiment. Set up your transmitter and adjust it to give 100W
key
down on CW. By this, I mean using the key to generate one long dash.
Then transmit a long succession of dots, what does your power meter
read?

The problem is in the power measurement, not in the transmitter.

Geoff

You want to try a hydrogen balloon.
Made one as a kid, flew a very long length of copper wire into the sky, reception was brilliant, keyed the mic and the balloon went bang, spent week covertly recovering wire from all the neighbours roofs.
